2. Hard Drive woes

Newsgroup: comp.sys.atari.st
Date: 1990-01-01 00:38:45 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5189@blake.acs.washington.edu>
Source record: 245196

Wondering if someone could help me diagnose
my hard drive problem...

Symptoms: Occasionally... and sometimes frequently,
my Quantum drive slows down and then comes
back up. When it slows i obviously can't
read or write to the drive.

Conditions: The drive has been running smoothly
and without a hitch since last February when i
bought it new. I have had it running pretty much
24 hours a day since i purchased it. I have a good
fan and the housing is always very cool to the touch.

My house definitely needs re-wiring. Fuse blows are common.
The other day, i came down to the basement and saw that my drive
and system must have lost power at some time during the night.
My monitor displayed just floppies. Later that morning, when
turning on the oil furnace, another fuse blew...

I didn't seem to have any problems with the drive the subsequent
day. A few things seemed strange while i cleaned out and zeroed
out a few partitions to install a 530,000 word dictionary..
unpacked it and ran some checks on the files with wc and grep...
the heads were working hard.. but i couldn't see how that should
harm a the drive in any way.

I moved the system upstairs to an office on a different electrical
circuit.. then i started noticing the spin problems.. for a
few days i tried different outlets and surge protectors etc..
sometimes the drive wouldn't even come up to speed. This morning
i moved the system back to the basement to perhaps isolate the
problem to be the house wiring upstairs..

I just sat down to my 1040 and saw that a file i had downloaded from
my host was not written to my drive: "Check drive.. could be damaged"
warning... i hit retry and the file saved.

So the problem is not intermittent... Therefore, it will be hard to
isolate it and make if fail for a technician. Anybody out there
ever have similar problems?

My guess and hope is that it is my power supply... i couldn't find
any info on "trouble shooting" in the quantum manual...

Thanks for the help

LHarc is the only compression to use are is passe and zoo is old. LHARC
is faster now compresses 3 times more than arc and has its own dearcing
or self dearcing file programs. Many BBS's use verbose lzh listings
now.

7. Looking for C source to spell program

Newsgroup: comp.sys.atari.st
Date: 1990-01-01 19:13:59 UTC
From: david@bdt.UUCP
Message-ID: <554@bdt.UUCP>
Source record: 245101

I have an archive of a program called "Micro Spell". The README
says that the source is available but I haven't been able to find
it. Does anybody have this source archive? The ARC file I have
was called "USPELL.ARC" and the README references an archive called
"SPELLSRC.ARC".

If anybody has source to any other spell checkers that they'd be
willing to share, I'd be interested.

Thanks.

8. PageStream fonts

Newsgroup: comp.sys.atari.st
Date: 1990-01-01 19:35:59 UTC
From: silvert@cs.dal.ca
Message-ID: <1990Jan1.193559.24673@cs.dal.ca>
Source record: 245102

I finally have a version of PageStream (1.8) which is stable enough to use, but among the many problems I am having, the fonts are weird. Tyme and Helv work OK, but Saturn and Hudson, despite the presence of printer files for these fonts, do not print correctly -- many of the letters appear only in outline form (i e and x in Saturn, about half the letters in Hudson). I don't use these fonts very much, but it is annoying.

Does anyone have printer drivers for some of the other fonts which PS supports only for PostScript, such as Symbol and dingbats? These would be nice -- the quality of the output on even a 9-pin Panasonic KX-P1180 is excellent!

It would be nice to pick up some tips about PS from this newsgroup, since the old PPPro manual is obsolescent, and SoftLogik doesn't seem to have plans to update it, just bits and pieces on loose sheets of paper with each new release. Do the new versions come with a up-to-date manual?

10. Make BIOS think screen is 80x20?

Newsgroup: comp.sys.atari.st
Date: 1990-01-01 20:43:21 UTC
From: nut@wet.UUCP
Message-ID: <897@wet.UUCP>
Source record: 245104

Can anyone out there in NetLand tell me how to make TOS think that the screen is only 80x20? What I am trying to do is implement a 5-line status bar across the top of the screen but still be able to use normal scrolling text. Is is possible to just push Logbase up while keeping Physbase the same, creating a bottom-of-the-screen area?

The german Atari Profi book reads on page 245:

COPY RASTER, OPAQUE(VDI 109)

void vro_copyfm(handle,wr_mode,pxyarray,psrcMFDB,pdesMFDB)
int handle,wr_mode,pxyarray[];
MFDB *psrcMFDB,*pdesMFDB;
{
intin[0]=wr_mode;
i_ptr(psrtMFDB); /* contrl[7/8] = psrcMFDB */
i_ptr2(pdesMFDB); /* contrl[9/10] = pdesMFDB */
pioff = pxyarray;
contrl[0] = 109;
contrl[1] = 4;
contrl[2] = 1;
contrl[3] = 1;
contrl[6] = handle;
vdi();
pioff = ptsin;
}

Call in C:
vro_copyfm(handle,wr_mode,pxyarray,&psrcMFDB,&pdesMFDB);

Hopes this helps.

13. ATW

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 01:35:05 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5199@blake.acs.washington.edu>
Source record: 245107

I've been reading comp.sys.transputer and comp.sys.next.
The ATW has been mentioned with high acclaim in both
groups... as a matter of fact... there is at least one
NeXT owner who wishes he had known more about the ATW before
he bought the NeXT.. particlulary now that he has seen one.

This person claims that the ATW has a good chance at
becoming a serious contender in the workstation market..
Perhaps even stealing some parties hooked on the NeXT.

How about the front cover of Byte.... seems like it wouldn't hurt.
Every other machine that's ever been made or made "into" anything
has made it on the cover...

14. Turtle 3.0's archive option

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 06:50:41 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891227.19144827.002918@SFA.CP6>
Source record: 245108

Hello all,

I've a question regarding George Woodside's excellent hard drive
backup utility. Regarding the archive bit....
I have TOS 1.4 and was hoping that the setting of the bit would
allow me to use the archive option to back up only the files that have been
added to or modified since my last backup.
This is not the case, though. When attempting a new backup, none of
my new, added, or modified files were flagged and put in the backup
window. In fact, nothing showed up in the window at all except for a
message saying that the backup had been successful. Yeah, right...
Ok, dullard that I am, am I misinterpretating what is suppose
to be really happening? Could someone tell me the "rest of the story"?

15. WINNER "UFO" JoyStick

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 06:50:42 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891228.21420606.003093@SFA.CP6>
Source record: 245109

Howdy folks,

If you are tired of the 'same old same old' joystick, give the Winner UFO joystick a try. This is an infrared cordless mouse that looks like a yellow version of the American Stealth bomber. It is great.
Your left thumb controls the directions via a small pressure knob and your right contrils the fire buttons. Interestingly, there is a 'turbo' mode which gives you rapid fire. Yep, this box gives rapid fire for the ST.
The receiver is a big ugly yellow box about the size of a fat deck of cards. Double adhesive tape is included so that you can attach this thing to your computer's side.
The infrared transmitter is powerful! You do not have to be careful to aim the stick toward the receiver at all. Indeed, I was playing Joust from about thirty feet. Sheesh, I didn't last long. Couldn't see the screen!
This is an impressive peripheral. Playing games while standing up lends to strange gyrations since you are no longer strapped to a chair. I can imagine how this thing could be via a projection tv and some really graphics/action intensive game. Shades of Star Trek's HoloDeck!
At any rate, I'm impressed, and the the klutz in me loves the rapid fire, something that I've never been able to get on any other joystick for the ST.
Just thought that everyone might like to know about this one. I've never seen it before. Oh well, back to my real world.... COBOL. sigh

17. 520 ST upgrade to 2.5 Meg

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 06:50:58 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891229.02092991.003128@SFA.CP6>
Source record: 245111

Guy Ridley writes about having difficulty in getting chips for upgrading his 520ST to 2.5 meg or so.

1) Can the ease of upgrading the memory be dependent on which version of TOS I am running, or are these entirely separate issues?

Entirely separate issue... I've had a 520, 1040, and a a few Megas upgraded. These were our lab's units and there were no problems. My personal Mega, a really near brain dead unit, was also upgraded. These units all span five years. No problems at all on upgrades.

2) One dealer says it will take three weeks, another says it takes an hour (and his cost is better too.) However, after 6 weeks the chips are not in yet. Other dealers confirm that the chips are hard to get. There is no dealer in the S.F. Bay Area that can do the work *now*, mainly because the chips are not available. Is this normal?

This is definitely not normal. See, folks? We used to complain about Atari's requirements for strong technical support in each store.

3) One dealer said that in January there will be a board that will accept plug-in memory chips. Is this really true? Will it really be in January (1990)?

There have been boards since 1986 which allowed for the plug in of memory chips. I would suggest raiding the magazine racks of your local book store and pull some ST magazines and scan the ads, but ST magazines are all but impossible to find except through subscription, at least in my area. You might have better luck than me. There are several boards though, at least their ads seem to be numerous.

What the SF Bay Area dealers are telling Guy astounds me and is another sad testament to the 'quality' of many dealers. My dealer in Fort Worth is a very small store and yet, has the ability to do such upgrades and OTHER modifications (rack mounting, acceleration, etc.), without much delay. His profit is up and he is quite happy. However, he hustles and keeps up on the detail of the product. He is also quite active in the local computer club. I really wonder if many of the dealers are really wanting to be spoonfed by Atari and the enthusiasts. It is just simply amazing to me that Guy's dealers are telling him these things.
I probably would not be reacting this way if it wasn't for the fact that my equipment, including the shop's, was upgraded or given an overhaul this month (December). No waiting for chips, nothing. He has an ample supply of parts. Ok, I quit. No more rambling...!

19. SLM804 / HP LJIIp

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 14:43:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <9001030805.AA24560@ucbvax.Berkeley.EDU>
Source record: 245113

A local user is looking into moving up to a Mega or a multi-meg STE for DTP work (currently, he is using Pagestream 1.8). He wants info about Postscript capability for laser printing.

1. Is there a PostScript board for the HP LJ IIp? If not, is there a slot in this printer for a PS board?

2. Can UltraScript use PS fonts or is it limited to US fonts?

The user is aware of the much slower speed of the LJ IIp but does not have high volume needs. The LJ IIp with .5 meg is $CDN 1495 and the SLM804 is almost $CDN 2000. With 4 megs of memory, it looks like the IIp would cost as much as the SLM804 making it a better buy (except for speed).

Can anyone provide more info on this topic?

20. C-Kermit date bug -- Anyone else find this problem?

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 15:00:48 UTC
From: dag@per2.UUCP
Message-ID: <890@per2.UUCP>
Source record: 245114

Two years ago, someone posted a version of C-Kermit in comp.binaries.atari.st (I think it was volume 7) in an archive (kerm_exe.arc). I no longer have the clear text that was in the posting and there is no pointer to the author that I can find in the files within the arc file.

There is a bug in this program that causes odd to fatal results when it is used in December, or used to transfer files in December. The source problem is that the month array (declared either local to the function "ztime", or static to the module that contains the function ztime) is declared something like
char *months[12] = {"","January",...,"December"};
Note that there are 13 elements in the declaration list. The problem is that the C compiler used to compile this module allocated enough room in the months array for only 12 pointers to char. (It still stored all 13 strings.) The result is that when ztime is called to do something in December, it treats the four bytes at &months[12] as a pointer, but these are the beginning of the next bit of initialized data which happen to be a string. The four characters are passed in a long as a pointer to sprintf then to xprintf where the "%s" in the format string causes an access to this bad value and BANG!

I was able to figure the above out without the source using the MWC symbolic debugger since CKERMIT.TOS is not stripped and was built with the MWC compiler. I looked at all the ST source archives I could find via FTP, and looked in the Columbia University Kermit source archives and could not find the sources for the ST C-Kermit. I don't have the name of the author of this port.

If someone out there has these sources and can make the change, please do. Also, I would like a copy of the sources myself if at all possible. I would like to add a few features to make it even more useful. (Full VT52 emulation, vt100 emulation, etc.)

> The computer could perhaps control how the mixing is done.

I think in general you are going to find this one is hard, assuming you mean mixing the signals as opposed to grabbing a frame. The outputs of the two VCRs need to be synchronized before they can be combined the same way the Amiga has to be synchronized with an external video signal before its output can be combined with it (e.g. Genlock). The customary way to do this with two VCR signals is with TBCs (Time Base Correctors) which still tend to be expensive devices. The lower cost ones I have used also tend to require relatively expensive VCRs that include the capability to accept an advanced sync signal that is feed back from the TBC.

Logically it would seem that you should be able to get away with one TBC to sync one VCR with another one that was free running but generally you find that in practice both VCRs have to be equipped with TBCs. This setup is often referred to as "A B Roll" in editing systems.

> I am also unsure of what computer platform to choose.

> - Atari ATW (provides 16 million simultaneous colors),
> - Mac II (provides 16 million simultaneous colors).

Can't comment on Atari. I think doing video from a Mac II is going to be expensive 1) because the Mac with 16 million color capability is itself expensive when compared to the Amiga, and 2) I believe the output from the Mac is not at standard NTSC video rates so it is incompatible for video production work and requires addition equipment to convert to suitable signals.

The Amiga on the other hand was designed from the ground up to produce NTSC standard video. It also has a built-in capability to synchronize to an external signal, thus making genlocks much easier and cheaper to build. Yes, there are limits on what the Amiga can do in terms of number of colors and so on, but nothing can come within a mile of it in terms of *cost effectiveness* in video production applications, and its price/performance point is at a *very* useful level of functionality for what a great many of us want to do. It is not suitable for broadcast network production, but it costs a few percent of what the networks do use.

It depends on how much you want to spend. The Amiga is cheap enough compared to the alternatives that you can buy it, get your feet wet, and then if you really want to spend the big bucks later your Amiga investment will only be a drop in the bucket. And it will still be useful for a dozen other applications.

Stay far, far away from D&S. It's a sloppily done port from MS-DOS to Mac to Atari ST. I lost three months worth of data and the program then trashed my back-up. Star Monogram refuses to support ST users. Their attitude is that there is not a large enough customer base to care about. I have been told by Monogram that there will be no update to the bug-ridden program that's out there.

I spent $80 on the package when it was new. Printing is only part of the problem.

If you want a dependable home accounting program for reasonable bucks, buy PHASAR from Antic. Or, if you have Spectre and can run Mac stuff, I would recomend Quicken.

Dollars and Sense for the ST is junk!

23. How many ST's have been sold?

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 18:45:50 UTC
From: gwa@mentor.cc.purdue.edu
Message-ID: <6170@mentor.cc.purdue.edu>
Source record: 245117

Does anyone know if Atari has said how many ST's have been sold in the U.S. to date, and how many have been sold in Europe? I would appreciate it if anyone could tell me this (and also where the figure was found).

Also, does anyone know of the demographic breakdown of ST purchasers?

I am interested in this information because I am writing a business plan for an entrepreneurial contest here at school.

Thank you in advance,

Jim Yegerlehner yegerleh@mn.ecn.purdue.edu

Gee, that sounds interesting. Don't try it unless you know more about this stuff than it sounds like you do.

In SALAD (Still Another Line-A Document) the negative line-A variables are documented, and among them you will find a "number of vertical alpha cells" variable (better known as "number of text lines"). Set this smaller than it already is, and you will have created a short screen with unused lines at the bottom -- lines you can use for your status stuff. Of course, you can't use Bconout to write to that status area... Unless you write in the true value for "number of lines," then go to the bottom and write what you want, then write in your fake "number of lines" value.

SALAD is available to developers in a couple of places, including online on GEnie and possibly other services. Or call Gail Johnson, (408) 745-2000, to get it (or become a developer if you aren't one already).

From: krieg@jupiter.uucp
Message-ID: <1782@mrsvr.UUCP>
Source record: 245119

My mouse is dying and I need to replace it fast. Can anyone recommend one of the 3rd party mice (I've seen a cordless, and another one by some company whose name slips my mind) or should I stick with the Atari. I have seen Atari mice manufactured in Taiwan and Hong Kong, and I've heard they were also made in Japan. Is one better than the other? I had a Tawainese one, and it has acted up all along. I think wires are crossing inside the main cable. The arrow moves in the opposite direction of what I want, sometimes. I shake the cord a little, and it will work OK for a short time. Can I cheaply replace/build a new cable?

Any info on any of the above questions would be greatly appreciated.

28. LHARC takes over? Sure hope not!

Newsgroup: comp.sys.atari.st
Date: 1990-01-02 23:47:15 UTC
From: grieggs@jpl-devvax.JPL.NASA.GOV
Message-ID: <6716@jpl-devvax.JPL.NASA.GOV>
Source record: 245122

Gee, I certainly hope that LHARC doesn't take over. Why? Three reasons.

1: It doesn't exist on many machines.
2: It isn't that good.
3: It's as slow as molasses.

I did a benchmark on my AT clone at work, using a variety of filesets and all the compression programs I had around. If there is interest I will post the actual numbers. The summary is that PKZIP wins hands down in most of the areas of interest to me - it is fast, and it compresses trees. The problem with PKZIP (and PKARC as well) is lack of source.

ZOO source is available in the PD, and ZOO has already been ported to most machines (right?). ZOO is comparable in speed and compression to ARC, and slower than PKARC or PKZIP. However, it does do trees, and thus has a real advantage over ARC.

LHARC was abysmally slow. Compression was better than ARC or ZOO, but no better than PKZIP. It takes sooooo looooong to do simple operations that it is simply not usable (IMHO). Does trees, tho.

The nice thing about ARC is that it exists on all machines, and everyone has ported it in such a way that it stays compatible. If you read the comments with LHARC for the ST (which I have run a number of times, by the way), there is mention of incompatibility. I believe the latest version supports some of the additional encoding methods, but there were still some arbitrary differences.

The only real advantage I can see to using one of the newer compression programs is the ability to compress trees. For a new compression program to be successful it must be fast, readily available for any operating system, and totally compatible across all operating systems. ARC is even usable on a MAC! For LHARC or ZOO to be successful, it needs to be ported to all of the common machines out there, from the Atari 800XL to the IBM 3090. ARC is there...

Well, I haven't been in a good flame war for a while. Have fun, if you must. I personally think that LHARC is not the way to go, and I am sure that all of you who disagree will let me know.

I should note again that I won't accept any comp.binaries.atari.st (or, for that matter, comp.sources.atari.st) submissions in lharc format until source code for lharc becomes available. This is partly for my convenience; I like to look at documentation and test archive integrity on panarthea before downloading the software to test it on the ST. But it's mostly for the convenience of all the other netters who've told me that they like to do more or less the same thing.

Once source code becomes available, I'll leave it up to individual submitters to decide whether to use it instead of arc or zoo.

30. system() call in dlibs120

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 01:06:48 UTC
From: mkentley@wpi.wpi.edu
Message-ID: <6453@wpi.wpi.edu>
Source record: 245124

I've been having a problem with the system() call in the dlibs120
library with Sozobon C, and I'm hoping that someone can help me out.
My bbs program uses the system() call to execute outside programs
(online games, file transfer, and STadel networking). When I run the bbs
under Gulam or JSH, there are no problems. Outside programs run normally.
However, to save 100K of RAM, I wanted to run the system without a shell,
leaving approx. 250K of RAM to run Galactic Empires etc.
To run the bbs without a shell, I put a program in my \auto
folder set up the environment. From GEM, I run the bbs program. The first
few times it calls outside programs, there is no problem. After calling
a few different programs via system(), the whole bbs keels over with
2 or 3 bombs, at some point during the execution of the system() call.
It looks like the problem is somewhere within the forkvpe() call that
system makes to run the program, but I really don't have a clue where to start
looking.
Any help with this would be appreciated.
Thanks,
Michael Kentley

32. Comparing Apple and Atari peripheral prices

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 03:00:02 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <9001030900.AA27398@ucbvax.Berkeley.EDU>
Source record: 245126

rochester!rit!ultb!clf3678@rutgers.edu (C.L. Freemesser) disagrees with
my statement that Apple (specifically Mac) peripherals are not limited to
the Apple brand and that the prices are comparable to those for the ST.

"Find a 3rd party Apple floppy drive that is totally compatible with
the Apple drives, and I'll show you a snowball that survived a trip
through hell.... "

I don't have personal experience with third party Apple floppy drives so I
can't argue this point. I'm only familiar with the Mac line, and have spe-
cifically limited my comments to this. Are you referring to Mac or Apple
II drives? What are you basing this statement on?

"Sure there are alternatives to the Imagewriter, but the I-writer
is the most used. Ergo, it is the most supported by software."

Third party Laserprinters and imagewriters do work with the Mac. There
are software around to make these compatible. My point is that it is there.

"Tell that to my friend who bought a new 3.5 inch Apple drive. The
retail price is $400! I spent about $100 building one for myself.
As for hard disks, I built one for my father's 1040...a 20 meg Seagate,
Adaptek, and ICD host adapter for $350. Beat that on a Mac."

I didn't say peripherals from Apple are cheap. I said 3rd party peripherals
are as cheap as those for the ST. All the prices you mentioned are for
"hacked" units. I'm sure if I had enough technical info on the Mac I
could build floppy drives and hard drives that cost the same as "hacked"
ST drives. The OEM's for the mech are the same. In fact, I know I can
easily beat $350 for a 20 meg hard drive: A SCSI 20meg mech (ST-125N is
advertised by JDR for $299 and I can just drop it in to an SE or a II.)
I don't know for sure if this would work, but it looks reasonable.

BTW, did your $350 include a new drive, cables, casing and power supply
in addition to the Adaptek and ICD host adapter? (ICD host adapter: $136.,
Adaptek controller: $90-140. = >$226 leaves $124 for 20 Meg mech,
power supply and case.)

I'm not going to comment on the last paragraph of you message. The direction
it's headed makes me uncomfortable. My purpose in posting my
original reply was to argue with kclenden@silver.bacs.indiana.edu >
kevin Clendenien's statement on the high prices of Apple peripherals and
the lack of 3rd party source compared to the ST. I'm not making any
claims on which computer is better. I really don't care.
I only care on whether they can do the job I bought them for. And so far,
both of them have been very satisfactory. If only I have more of my own
money, then I can enjoy and make more use of this 1040ST.

Regards,
Marcelino Bernardo

I have an Atari 1040ST for sale.
I give it for $400.
Postage is mine if you are in the USA.
I can send it COD.

It includes:

- The 1040 console
- 720K flopy drive
- Mouse
- ST124 Monochrome Monitor (one of the old ones. Very good quality)
- Cables
- Manuals for ST-Basic and ST-Logo

Also:

- About 50 flopies of public domain programs (double side).
- And Games!
- About 20 blank flopies (double side)
- About 15 flopies from magazines.
- Mavis Beacon Typing Tutor.

And a problem:
- Since a got the system one of the RAM chips does not work.
I know which chip it is (U48).
(Jim Tittsler from ATARI told me. Thanks!)
- Unless you replace that chip the system will work only
with 512K or RAM.

You can send me mail (see below) or call me at:

Source record: 245129

Hello netters,
does anyone know something about the use of coprocessors with PC-emulators? a) The co-processors in use with the atari 68000er b) The co-processors in use with a ibm (8087,80387SX). My second questions is if the procesors of atari are used by special atari-programs, for instance statistical ones and which of the offered processors are any good. The second is if these can be used with pc-emulators as ibm-coprocessors or the same thing arround if ibm-processors can be used as well with the atari. The last thing for today is if the blitterchip of the mega can be built in a 1040er and if it makes emulation faster too or if there is software arround which speeds up operation in work with atari and ibm-emulation as well as co-processors and blitter-chip can. Think this is enough for today and wish all of you a nice 1990. If you know something of interest please email to so01@dmarum8.bitnet.
Thanks in advance
Thomas Neser

> I have TOS 1.4 and was hoping that the setting of the bit would
>allow me to use the archive option to back up only the files that have been
>added to or modified since my last backup.

Your problem is simple: timing.

I haven't had time to do a new version yet.

TOS 1.4 reverses the significance of the Archive bit from the prior
TOS versions. Turtle has to be modified to deal with the Archive bit
properly, for whatever version of TOS you are running. It will be as
soon as I get past a few other, higher priority items.

Meanwhile, there is a more frequently occurring problem dealing with
directory create failures in the RAMdisk, which I've been trying to
re-create. When I can get that to occur reliably, I can deal with
it and the archive bit.

Both problems, however, take a back seat to the current work on the
Virus Killer. Which, in turn, is slightly behind an even more critical
hard disk failure problem.

If anyone has a few 300 day weeks they can spare, I could use them. :^).
Working for a living sure cuts into my day.

>My guess is that the ability to read is failing on your servo track.
>This surface is used to control speed and bit rate.
>BACK UP YOUR DRIVE! IT WILL SOON BE DEAD!

One suggestion from my own "Dumb Larry Experience" is to go ahead and FIRST try some maintenance before attempting any backups!!! In my own use of some brain dead equipment, or at least retarded, is that if a drive fails when you attempt a backup, then you will, in most and all probabilities, loose that file along with others--missing clusters, and all of that good stuff.
Do some hardware maintenance: cleaning and possible connector replacement first.
Try this.. Remove your case top. Get some tuner cleaner and clean the connectors going to the hard drive mechanism from the power supply. Clean them exceptionally well. I've found that some connectors are only using aluminum material which will oxidize in some climates. These are particularly bad in my area where we have problems with salty air from the Gulf of Mexico.
I had to dress my connectors twice a year on my hard drive. I finally replaced them with automobile electrical connectors (these are made of brass, I think), and have yet to have any problems.
For a test, just snip off the connectors, connect the wires and solder them via a pigtail fashion. See if your drive works. Obviously, try the cleaning before you go to this step since this step might be unnecessary (disadvantage of composing on-line--rambling!). If cleaning solves the problem, then I'd replace the connectors with the automobile electrical connectors. Anyway, I think you see my point.
Note that with all of your failures, you will probably have some corrupted files anyway. First, though, try to address the slowing down problem by dressing your connectors. See if the connector maintenance stops that. If so, then, do as Howard says,

back up what you have. Then do a drive check via TuneUp or any of
the other hard drive utility optimizer programs.
Again, I think your connectors from your hard drive's power
supply are the problem. Sorry about the rambling..

42. EZ Score Plus file formats

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 17:31:14 UTC
From: mike@system.Cambridge.NCR.COM
Message-ID: <559@system.Cambridge.NCR.COM>
Source record: 245136

I sure hope someone out there can help me with this one, I have no idea.

For Christmas my son got EZ Score Plus. He says it uses SCO(?) format.
At high school he uses another midi program for a Music Theory course.
He would like to be able to move files back and forth between these two
programs. He would like a program to convert files between the EZ Score
format and MIDI Standard (which the PC program can use). Does anyone
have a program like this? If all else fails, does anyone know what these
formats are? We can write the programs.

thanks from both of us,

mike and joe

43. Omikron-Compiler instructions ??

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 18:01:10 UTC
From: a_kowald@NIMR.MRC.AC.UK
Message-ID: <9001031801.AA23113@nimsn41.>
Source record: 245137

Hello everybody !

I started to work with Omikron Basic for the AtariST and recognized that my
compiled programs need the file 'BASLIB' which obviously contains library
routines and which will be loaded by the compiled program.
I am now pretty sure that there is a way to tell the compiler to produce a
program which contains already this library routines, but I have no idea how.

I will be very thankful for any suggestions.

Axel

You need to slow down the seek rate for the 5 1/4" drive in order for it to
work properly. There are a few programs available for doing this, try looking
in the panarthea archives. I beleive DCformat can do this as well as SCHIZO.

| Gee, I certainly hope that LHARC doesn't take over. Why? Three reasons.
|
| 1: It doesn't exist on many machines.
| 2: It isn't that good.
| 3: It's as slow as molasses.
|
| I did a benchmark on my AT clone at work, using a variety of filesets and
| all the compression programs I had around.
.
. (text omitted)
.
| LHARC was abysmally slow. Compression was better than ARC or ZOO, but no
| better than PKZIP. It takes sooooo looooong to do simple operations that it
| is simply not usable (IMHO). Does trees, tho.

Gee, I'd venture the opinion that LHARC runs lots better on the ST than
it does on an AT clone!

I ran some tests on my ST this weekend. LHARC .51 was slower than ARC
5.21 but it was neither abysmal nor unusable. It took maybe 30% longer
to compress; un-LHARCing seemed comparable to un-ARCing. LHARC did a much
better job of compression - up to 25% better in my tests! I concluded
that any extra execution time was compensated many times over by the decrease
in download times (and costs) due to the superior compression. Therefore,
I don't mind using LHARC for GEnie uploads/downloads or other BBS downloads
at low baud rates.

As for Usenet binaries, Steven Grimm has stated that LHARC source must
be available before LHARC'd binaries are acceptable. When/if that happens,
I would think that conservation of net bandwidth should make LHARC the
preferred program.

(Then again, I hear ARC 6.0 is out and it is supposed to be better than
LHARC....)

46. STEs

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 18:33:31 UTC
From: qralph@dna.lth.se
Message-ID: <1990Jan3.183331.17370@lth.se>
Source record: 245140

As I quickly got "famous" for revealing secrets about ataris (nope, still
got no secrets from Atari, and no excuse from Alan Pratt) here's some new
ones:

In the STE there are four SIMM sockets. So what to be found there? Well:
Looking at the photos in ST World, Nov. '89 (an English magazine) all
four slots are full, on each card there are 8 Korean 100ns chips,
marked KM41C1000A3-10, thus one megabit chips.
I recently opened up one 1040STE and one 520STE, and found in the 1040STE:
4 cards, two 256 kx4 chips on each
In the 520STE
2 cards, 8 256kx1 chips on each.
This means the 520 must be easier to upgrade, right. And it is MUCH cheaper...
Then, as noone asked me to go on refereeing the German magazines I won't,
but I can comment that in one of the January issues they told about 6 patches
to do in the TOS 1.4 chips. This includes the software patches you put in the
AUTO folder. Also something about the MEGA clock chip, to read the boot device
nd a couple of things besides.
Oh yeah, they also told how you simply could use 1.44Mb drives etc.

48. Re: Unexpandable megas

Newsgroup: comp.sys.atari.st
Date: 1990-01-03 22:01:10 UTC
From: dclemans@mentor.com
Message-ID: <1990Jan3.220110.409@mentor.com>
Source record: 245142

In the systems I've seen, the "unexpandable" Mega 2 board does not look like a new PCB layout. Instead it looks like the original layout artwork with the second memory bank covered up so that that area stayed all copper.

My theory is that they ended up with a run of memory controller chips that would not reliably drive a 4mb system. Rather than throw those away, they decided it was cheaper to do a kludge run of "unexpandable" Mega-2 boards, stuffing the "bad" memory controller chips into them.

> Aerco "easieST" solderless ram upgrade for a 520? The literature
> that came with the board claimed that the board would hold up to
> 4 Meg, but neglected to state how the extra ram should be added to
> the sockets provided. Since I could not afford the 1 Meg ram chips
> when I bought the kit, I didn't bother finding out how it was done.

While the Aerco board can be upgraded to 4mb, it is NOT just a simple matter of swapping chips (at least for the early boards that this message talks about). There are a number of traces that have to be cut, jumpers that have to be added, resistors that have to be swapped, etc. The upgrade instructions were on the order of 10-20 pages.

Note that the above doesn't apply for a 2.5 meg system; those were just chip swaps.

To go to four megabytes, you have to cut traces/add jumpers to allow one of the memory banks to take 1mb chips (256kb chips and 1mb chips are not pin compatible; the Aerco board was shipped with one bank set up for 256kb chips, and the other bank set up for 1mb chips; to goto 4mb you have to rewire the bank that was set up for 256kb chips).

Sorry, it doesn't. Neither did any of the other numerous C examples. I need a working example in assembly. C does quite a lot of the work itself, and an example in it covers up details which I might need (that's why you use C, right?).

I'll be posting an analysis of the menu probably sometime next week.

From: bro@eunomia.rice.edu
Message-ID: <4096@brazos.Rice.edu>
Source record: 245150

Thought I might drop in my 2 cents:

I typically write routines dostart() and doexit(exitval) in programs
which run in low res but for which I want to use 80 columns:

dostart saves the current resolution and if it is low res, changes
to high res and plays with the palette (and whatever other changes I
need, like turning on the cursor, etc.). Thus dostart contains a call
Setscreen(-1L, -1L, 1) as needed - and it doesn't crash.

doexit restores the original palette and resolution, and then calls
exit(exitval). Thus doexit contains a call Setscreen(-1L, -1L, 0) as
needed - and it doesn't crash.

I just call doexit then wherever I would be calling exit otherwise.
If the system crashes, I might be screwed up, but the worst would be to have
the parent wind up in the wrong resolution with funny colors, and that can
be fixed. But my programs do not crash :-) of course.

I use a program like this from my auto folder - but only use bios and xbios
calls in it.

Hi, Christian!!!

CP>Hopefully, 1990 will bring me an STE... So I can have something
>else to "ooh, and aaaahhh" on my desk

An STE sure would be GREAT!!! Are the STE's 'all-in-one' like
the 520STfm's are, or do they have the CPU separate from the
keyboard?

Unfortunately, an STE is FAR into the future for me... I still have
to get a color monitor for this 520STfm of mine! But first I
have to replace the drive...I've been told that it has one year to
live, and that I will start having troubles reading the higher
numbered tracks soon...oh great!

CP>beside my Amiga (groan!)

What model of Amiga do you have? I'm a true Atarian, and do take
the occasional pot shot at Amigas, but I do like them actually.
The reason I get against them is because most of the Amiga owners
in Brandon have the attitude of "My Amiga kicks your Atari's
butt and your Atari has the chips of a Vic-20 and your Atari can't
do anything...etc."

CP>I like my old ST, however, I'm looking forward to the STE...
>Upgraded to 4 megs, bien sur!

The STE's run all old ST software, hmmm? How much are the STE's
going for these days? Maybe sometime in the future...

CP>Cheers, western lass! (yup, Manitoba is west of here, last time I
>checked it still was, anyway!)

<GRIN> Take care, eastern garcon!

HEY, by the way, is there anyway to send accents with an ST with
FLASH v1.6 software?

Just thought I'd say a few things:

First of all, can anybody please mail me arcgsh version 2.1? All attempts to get this program from wuarchive.wustl.edu have been a complete and total failure. I'd appreciate it.

As for the ZOO -VS- LHARC discussion, I use ZOO quite a bit. Currently, I am converting the Atari ST files on an 8 line BBS in Florida over to ZOO. The things I like about ZOO are:
1) It compresses, ussually, better then ARC does. We've saved quite a bit of disk space.
2) There are some nice features. It is USEFUL to have the ability to add a comment into that archive, many has been the time I have downloaded a file and forgot what it was. I also like the fact it saves the complete pathname of the file. None of this archives-within-archives stuff to preserve pathnames.

LHARC might compress a bit better, but it it not as widely used as LHARC and as available on other machines.

I thought about this after I posted - the speed of LHARC will depend in part on the port and the machine it is running on. It runs quite a bit faster on the AT, incidentally. When I get something in LHARC form, I normally undo it on the AT and tranfer it over via 3.5 inch floppy (if it fits) or 19,200 baud cable (if larger than 720K). It seems faster to un-LHARC on the AT and transfer serially, than to un-LHARC on the ST, but I have not benchmarked that one...

63. media change problem with Toshiba drive

Newsgroup: comp.sys.atari.st
Date: 1990-01-04 04:35:17 UTC
From: landry@enginr.dec.com
Message-ID: <7193@shlump.nac.dec.com>
Source record: 245057

I read most of the messages on using generic drives with the ST and
didn't expect any problems but . . .

I'm adding a Toshiba ND-352TH-A also known as FDD4216G0D as a
second floppy. If I leave the media change diode
(pin 34 ---|<|--- pin 28) out, everything works fine, except of
course media change is not detected. With the diode, once the disk
is removed once it always appears write protected.

So I looked at the signals (only have a logic probe at home - but
it's a good one :-)). The "no media change" condition is
indicated by a "high" on pin 34 (jumper selected for this function)
all the time. "Media change" is indicated by that pin toggling
with no drive select or constant low when the drive is selected.
It seems that the only way I can get "no media change" is to
power up the new drive with a disk inserted AND then reboot the ST.
Once the disk is removed once, "media change" is always indicated.

So, my questions are:
1) What is the media change signal really supposed to do?
I guess that really is, what does Atari expect it to do?
2) What is supposed to reset it from the "media change"
condition?
3) Is it possible to use this drive with the ST?

thanks
chris

Arcgsh is the best reason I have ever had to install a shell (gulam, msh, any keyboard oriented line-at-a-time shell at all). Yes, I was using 2.1 and IMHO it's at least 5 times as much work to use as the raw commands themselves. Faugh!

Re the compression issue: let's go with zoo; it's available in source and reasonably quick, and it indeed does hierarchies properly. ARC is getting a little old and crufty.

What is this? We've seen all this bullshit before. Give me a break! Apparently you haven't a clue why some compnaies do what they do, and are so short sighted, you think that they'd like to screw themselves.

The simple reason (if you would have thought about it before you posted this crap) is that Atari had the licenses for the games, and decided to publish the games for other systems. Christ, even Atari realizes there are other systems out there, and if they could make money selling games for those systems, why not?

Atarisoft showed up as the bottom was falling out of the home computer market in 1984. Everyone started to go out of business.

If Atari, or anyother company publishes software for other systems, it isn't a sign that their own system is a failure, but as a way to make money, THAT'S BUSINESS!

Yes, and in no uncertain terms, this is a flame. Apparently you are some narrow-minded Amiga dweeb, trying to say that the ST isn't doing well. Why in the hell do you post messages here? Don't be so bloody smug, trying to stir things up. This is an old post, and I am tired of seeing people like you post this shit.

67. STACY features : Good or not

Newsgroup: comp.sys.atari.st
Date: 1990-01-04 09:34:11 UTC
From: alex@hpgnd.HP.COM
Message-ID: <4280004@hpgnd.HP.COM>
Source record: 245061

Hi people

I would like to know a bit more about the STACY computer of ATARI Corp.
As far as I know it has the following features :

1 Meg to 4 Meg memory
Good LCD screen
Good keyboard with 'Mega touch'
Trackball or external mouse if wanted (selectable by a switch)
All 1040 interfaces (Use of external video is possible)
Floppy 720K
May have internal hard disk (20 M or 40 M) 28ms of access time
TOS 1.4
Built-in Clock

GCR is perfectly running on it , BTW it makes a not very expensive
portable MAC.

It seems quite good to me , what do you think of it ??
Is there any features that I have forgotten , or am I wrong on
some of them ?

I still have other questions:

- Is there a blitter ? if not , is it possible to add one.
- Is the 1Meg model upgradable to 4Meg ?
- Is the LCD screen fast enough for games or text scrolling ?
- Prices ?

Since I may want to buy one , I would like to know your opinions ...
Thanks for your answers in this group.

alex@hpgnd

Depends on what you like and what you do not like. Surely
Arcgsh is nothing for people who like command line shells and
are able to remember all the options a program has, and
especially Zoo has *many* of them.

Arcgsh was designed for people who 1) like GEM or 2) do not
want to remember all commands and options of Zoo, Arc etc. in
order to keep their heads free for more important things.

If you like to use Arcgsh in general but do not like details of
user guiding please mail me you suggestions!

the MWC compiler did work around this TOS 'bug'. This worked in with the
GP-Shell (part of the CRAFT package) and probably also with MSH and gulam.

The TurboC linker doesn't like these long command lines. Neither can it be
told how it understands these :-(.

What can be done is to give the TurboC linker a file describing what to link.
I have written a shell script (actually, a function, but these are not available
under gulam) which does translate a line like
link -o my_prog.ttp main.o aap.o noot.o mies.o -l tos -l flt -l wim
to a file like:
a:\lib\startup.o
-O=my_prog.ttp
main.o
aap.o
noot.o
mies.o
a:\lib\tctoslib.lib
a:\lib\tcfltlib.lib
a:\lib\tcwimlib.lib
a:\lib\tcstdlib.lib
where aap, noot, mies, wim are dutch equivalents for foo, bar etc.

Not having this script on-line i can't help directly; but everybody should
be able to construct such a shell script. (Or write a C program; but make this
C program accept a long commandline! (by using sobozon or MWC C.))

> P.S.> Could some kind soul please repost the "all about terminate handlers"
> article here? Thanks.

Sorry, i don't have this document, but i have prepared another one. The file is in Info-format, suitable for reading with GNU-emacs, but it should be readable as text too.

Hope this helps!

- Edgar

---------- cut here ----------
Info file: etv_term, -*-Text-*-
produced by texinfo-format-buffer
from file: etv_term.txi

This file documents the TOS terminate handler etv_term and what you can do with it.

File: etv_term Node: Intro, Prev: Concept Index, Up: Top, Next: Top

The Terminate handler
****

Some people on the net asked for documentation about the terminate vector. Here is what i have collected over the past few years. Some of the details required a lot of experimenting, but all the presented solutions work with all TOS versions (although undocumented features are used).

- Edgar

File: etv_term Node: Top, Prev: Intro, Up: (dir), Next: Actions

When is the Terminate Handler called ?
==========

The logical vector #0x102 "etv_term" at address 0x400 is called by `Pterm()' before a program is terminated. This can have several causes. Either

1. an explicit call to

* the gemdos functions `Pterm0()', `Pterm()' or `Ptermres()' or

* `trap #2' with argument 0 in register D0 or

2. another program (a resident monitor like templmon or a shell or an accessory) directly calls one of the above functions or

3. `Pterm()' (in early TOS versions `Pterm0()') is called from one of the exception routines (after some bombs or mushrooms have been drawn) or

4. `Pterm(-32)' is called when ^C is pressed during screen-I/O

Since in cases 2--4 above the user program normally has not initiated the program termination, the terminate vector is the last (and only) chance to do some cleanup work before execution is finished.

* Menu:

* Actions:: What can a terminate handler do
* Call:: How the handler is called
* Installation:: How to install a handler
* Concept Index::

File: etv_term Node: Actions, Prev: Top, Up: Top, Next: Call

What you want to do in the Handler
==================================

Before Program Termination (cases 2 + 3)
----

* give some good-bye message to the user

* flush buffered output streams (files are closed after the call to etv_term by TOS)

* deinstall modified system vectors (*Note Installation::)

* modify the return code to signal an error condition to the calling program (*Note Return Code::)

* prevent termination (probably after asking the user) and go to a safe place to restart the program (for example the prompt in an interpreter) or enter a debugger (in case 3 above)

If ^C is pressed (case 4)
----

* ignore it completely (*Note Ignore ^C::)

* ask the user wether to ignore it or to terminate the program

* go to a safe place and cancel the current action of the program

So what we need to know about terminate handlers are the restrictions, which TOS-functions can be called, how we can access the parameter to `Pterm' and how we can resume execution at the place where ^C was pressed.

* Menu:

* Restrictions:: What can be called from a handler
* Return Code:: access the program's return code
* Ignore ^C:: avoid program termination

File: etv_term Node: Call, Prev: Actions, Up: Top, Next: Installation

How is the handler called ?
==========================

The etv_term vector is called via `jsr' in supervisor mode. The
calling routine (`Pterm()') was called in C with one parameter (the
return code for the program) on the stack (*Note Return Code::).

File: etv_term Node: Installation, Prev: Call, Up: Top, Next: Concept Index

How can i install my own routine ?
==================================

If you are in supervisor mode (after a call to `Super()' from user
mode with a parameter != 1L or in a routine executed by
`Supexec()') you can directly set the variable at `0x400' to
the address of your routine:

```
*((void (**)()) 0x400) = own_routine;
```

More portable and the recommended way is a call to the Bios function #5
(`Setexc()'):

```
old_routine = (void (*)()) Setexc(0x102, own_routine);
```

The terminate handler itself has no parameter and no return value:

```
void own_routine(void);
```

File: etv_term Node: Restrictions, Prev: Actions, Up: Actions, Next: Return Code

What can be done in a terminate handler ?
===

This depends on what should happen after the handler has finished. We
have three cases:

1. cleanup and terminate execution of the program

2. resume execution at some safe point (eg. top level of program)

3. ignore the termination request (*Note Ignore ^C::)

In case 1 we should restore the original terminate handler before we
leave our program. This can be done like the installation with

```
Setexc(0x102, old_routine);
```

If our terminate handler is not removed before other programs are
started, the handler will also be called when these other programs are
about to be terminated. In a shell this can be used to control the

behavior of other programs with respect to ^C.

In case 2 we should return to user mode since this is the normal mode of execution for user programs. This can be done with a call to the gemdos function `Super()' after calling `longjmp()'. A sample code fragment could be this:

```
#include <setjmp.h>

jmp_buf global_exit;
long stackpointer;

void
terminate_handler(void)
{
...
longjmp(global_exit,1);
}

toplevel_routine()
{
int ret;

...
stackpointer = Super(0L);
ret = setjmp(global_exit);
Super(stackpointer);
switch(ret) {
...
}
...
}
```

In the cases 1 and 2 you may call any routines (including gemdos, bios, xbios, aes and vdi) since we leave the normal flow of execution anyway and so no information needs to be preserved. But you have to be careful, if `Pterm()' was called as the result of a processor exception (eg. bus error): probably some internal data structures are in an unstable state.

In case 3 it is important to know where the `Pterm()'-call happened. As a thumb rule you can call xbios or bios safely from any place. But if you have switched to user mode (and want to decide between cases 1, 2 or 3 later), you cannot use the old userstack. Some people might prefer using the user stack in supervisor mode too. Also gemdos - if called from user mode - uses a part of the user stack below the user stack pointer (~40 bytes) to save some registers. And this is just the case if `Pterm()' was called via `trap #1'.

File: etv_term Node: Return Code, Prev: Restrictions, Up: Actions, Next: Ignore ^C

How can the argument to `Pterm()' be accessed ?

`Pterm()' is called from C. The argument to `Pterm()' can
thus be found on the stack. Since it is also programmed in C we can
access the parameter with the help of processor register A6 the
frame pointer in C. `Pterm()' calls (*etv_term)() directly. At
the entry of our routine A6 still points to the right frame. So
we can get the return value for the program (the parameter of
`Pterm()') simply as the word 8 bytes above the frame pointer (as
usual in C).

The value of the return code can be read and compared against -32 to
decide wether ^C was pressed (or `Pterm(-32)' called). So we can
distinguish the several causes for a `Pterm()'-call. We can also
change this value on the stack to change our program's return value.

If you are using KAOS-TOS (some patches to Blitter-TOS from the german
magazine c't - don't ask me about it since TOS 1.4 is certainly better)
the return value if ^C was pressed is different. Here it is -68 if ^C
was pressed and -69 if an exception occured.

File: etv_term Node: Ignore ^C, Prev: Return Code, Up: Actions

How can ^C be ignored ?
=======================

Several solutions exist for this problem. One is to use only functions
ignoring ^C for screen-I/O (`Crawio()', `Crawcin()' or bios
functions).

But you can also use the terminate-vector for this task. TOS was
programmed in C and the compiler did not know that `Pterm()' is not
supposed to return to the calling routine. Now if `Pterm()'
returns no surprising effects are observed and the execution goes on as
if ^C was not pressed. But remember that this is not guaranteed to work
to all eternity (but it works from TOS 1.0 - 1.4).

To ignore ^C all you have to do in the terminate handler is to check for
the return value -32 and before the rts instruction do an extra
`unlk a6' to pop the frame of the C-function `Pterm()'. The
program will continue as if ^C was never touched.

Yes, there is a Genlock for MEGA {24}, and its expensive.

I have seen vidi-st at work and it looks promising for many applications.
In my case I am trying to produce "reasonably interisting" home vidio work.

Vidi_st can save many frames, and substitute portions of one frame with another.
Also its output can (should be) input to cyber studio. This software can
record single frames on Smart SONY VCRs and Cameras.

If this works, I'll let you know.

74. Megas in clone cases...

Newsgroup: comp.sys.atari.st
Date: 1990-01-04 15:35:52 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900104.09355056.038329@SFA.CP6>
Source record: 245068

Hello all,

If anyone has any experience on working with clone cases, contact me. Specifically, I'm moving a Mega 4 and a hard drive mechanism into a baby AT case. The only problem I'm encountering is really cosmetic and that is where I need help.
The problem comes in the ports. I'm wondering if the expansion slot blank covers can be purchased with DB25 and din holes. Other than the ports, the project is complete (duh, what's an ST without ports?). Everything else looks "factory", turbo switch, reset switch, etc. Just the port area. If I can't find any slot covers with holes, I'll have to make my own somehow. Again, the problem is purely cosmetic but I'd like to make the case look "factory". I could have the existing ST cables run out and through the back but that wouldn't look good.
If anyone can offer some advice please contact me. THANKS!!!

A friend of mine is an Apple enthusiast, and he has told me all about
the incompatibility problems with Apple drives. Since the Mac uses a
non-standard variable speed drive, making one yourself will be very
difficult. Also, the fact that the Mac uses an electronic eject while
everybody else uses a manual eject will complicate the problem even
more.

>BTW, did your $350 include a new drive, cables, casing and power supply

Yes, it included a brand new ICD Host adapter ($100), an Adaptec 4000
($85), a Seagate ST-225 mech ($120), a power supply and case, and all
needed cables. I must admit that I got the mech from a friend of mine
who owns a computer store, and pulled the 225 out of a machine he was
upgrading. The rest of the stuff was purchased from mail order houses,
and YOU TOO can get them at this price.

>
>I picked up a copy cheap from my dealer under the impression that
>MetaComCo had dropped it.

As I recall when I was trying to purchase MetaCompco's Lattice C:

The U.S. Distribution office (somewhere in CA) was closed down in
an attempt by MetaCompco to reorganize to save money. However, as of
last year anyway, you can still order directly from MetaCompco, U.K.
(As long as you mail them a money order in British Pound Sterling
denomination.) The proces for their products in the U.K. were only
slightly more expensive than in the U.S.

Products they were still making/distributing in April 1989: for the ST
MetaCompco Assembler
MetaCompco PASCAL (now 100% compatable with Turbo Pascal
in the IBM world)
MetaCompco Lattice C
MetaCompco Cambridge LISP
MetaCompco Modula II
MetaCompco STILT (??? Don't ask me, I have *no* idea)

All of these products come with the MetaCompco shell...a menu
driven shell that runs from the desktop called MENU+. MENU+ can
also be purchased seperately.

Now, I know their products are no longer up to the snuff of items
like Laser C (which I bought to replace Lattice C) or MWC...but
I am one of the original ST owners. (Bought a 520ST in latter half
of 1985...its still ticking just fine, thank you...even though
I hacked the hell out of it with a soldering iron. :))

Way back then, MetaCompco was *the* only language vendor alternative
to the ridiculously priced Atari Developer's kit. (They only
had the Assembler and PASCAL then, so I bought both.) There was a
linker format war that went on that it looked like MetaCompco would
win, until MWC, MegMax and others powered onto the scene...

As such, I still have a soft spot in my heart for Metacompco...I hope
their other ventures go well..

>
This is a common problem with home-brew drives. There are a number of
solutions to this problem:

1) Get TOS 1.4. It fixes the problem for good by forcing a re-read of
the disk every time it is accessed.

2) Run a jumper between pins 2 and 28 of your drive. On some drives,
this will solve the problem. However, the ND-352 isn't one of these.
The signal becomes too weak. TO boost it, use a 74HC14 buffer chip.

3) Install a momentary on switch between pins 2 and 28. When you insert
a disk, hold the button down, and it will detect the media change,
and not screw up write protect. This is somewhat clunky, but it
works.

> 1) What is the media change signal really supposed to do?
> I guess that really is, what does Atari expect it to do?
> 2) What is supposed to reset it from the "media change"
> condition?

The ST hooks these two lines together (pins 2 and 28). As I said
before, just hook em together.

> 3) Is it possible to use this drive with the ST?

Yes, very possible.

I've just started playing Chaos and I've been very dissapointed by a bug
I've come across
which causes the game to crash out with two bombs.

It's caused if you walk past the wall with the words "Give up - pull the
lever" then take a right and
try to climb down a rope into the pit on your left. The game just crashes !!!

You have been warned ...

Jamie.

82. OMEGA - any players out there ?

I've recently bought OMEGA - a tank game with a strong similarity to
CORE WARS in that you
design and program tanks to fight battles and if you win you are awarded
a greater budget which you can use to improve your design.

You can also play against tanks created by other people.

Does anyone else have OMEGA and want to exchange tanks for a battle ?
Perhaps even for a
team competition ???

Cheers,

Jamie.

Oh, maybe this explains why I sometimes have to reboot my Mega-4 two or three times before it autoboots from the hard disk. I have TOS 1.4 in ROM and am using a Supra 60M hard disk and Supra driver software. Has anyone else experienced this problem?

Bill, our PHAST Times newsletter is produced using PageStream 1.8
and printed on a SLM804 laser printer (the SLM804 is used at Computer
Works, our local Phoenix area ST store). Our PHAST editor is a guy named Jim Kehoe
who is very happy with version 1.8.

As far as a new manual is concerned if you would call Softlogik I believe that
you would hear that a new manual is available. I read a message on GEnie to
the effect that users who ordered the $25 upgrade to PgS 1.8 got a new
manual. I didn't know that when I sent in my $10 upgrade or I would have
sent for the $25 upgrade.

In any case there is plenty of help for you if you can get a GEnie account.

Good luck with PgS 1.8

Well, another Christmas has passed and that means that lots of boys and girls were happy to find an Atari under thier tree. I didn't get one (another that is). But anyways, 'twas on Boxing day that my (now famous) Toronto Atari dealer put on sale some STE's. The price was $1200 (CDN). I assume that is fair since you got a 1040STE and a colour monitor in the deal. Regardless, the seven he had on hand sold in the first twenty minutes he was open, and he took cash deposits on, wait for it, thirty-plus more. Not a bad day sales wise I should think. The manager informed me that he had been selling off the old 520 and 1040 stock for about the last month, and hadn't anticipated the demand. Life goes on...

Now that Xmas is over and every kid around has a Nintendo GameBoy, I guess
Atari can go ahead and release the relatively unknown Lynx. Couldn't
they speed it up a little and get it out the month before Xmas ? I know
they're not braindead over there ...
Someone, somewhere is going to tell me that they have one, right ?

First.. THANKS to all of you who have offered me advice.
I am very appreciative and grateful.

Unfortunately, Larry, i already mailed my drive off to MacLand
in Tempe before reading your article... here's what i have
learned in the past few days about certain Quantum drives:

My dealer tech had heard about a bunch of quantums at Boeing that
were sent back due to some "oil" leaking on to the media and causing
the heads to stick.
He wasn't any more specific than that as he had heard this idea
from someone who heard something... etc...

I called the techs at MacLand.. who, by the way, are incredibly
helpful and very willing to listen... the tech there, Jay Denton,
thought it might be the power supply... but, as Howard told me, it
might also be in the servo track or motor...

I called the Quantum rep... he gave me several possible diagnoses:
Power supply.. any deviation of .6 volts off the 12 volt line or the
5 volt line will cause the drive to power down.. not always to a
full stop..

He also described a problem with some "fluid"... had never heard
of the "oil" scenario nor of the "recall"...

Talked to a friend in Boston who immediately knew what i was
talking about.. had heard of the Quantum 80 problems people
were having..

Called MacLand again and talked with Jay.. he knew about the
"oil" "fluid" "lubricant" problem.. it is documented by Quantum,
and a chip fix is already available.. also.. the newer drives
have the chip on the drive:

The FLUID they are all talking about is the lubricant in the
sealed cylinder that houses the actuator arm for the heads.
Apparently, under dusty or humid conditions (even though
it is sealed) the lubricant gets globby or ceases to function
properly.. and thereby does not allow the heads to move
where and when they want to.... the solution is a chip
that forces a random seek across the plates when the drive
senses inactivity after a period of x minutes.

Supposedly, there's a 24 hour turn-around time.. so i should
be getting the chip added to my drive and all will be ok.
In the meantime, i have cleaned the dust out of my case and
will heed Larry's advice and maintain the contacts he was
mentioning above...

How about a postscript emulator for the HP LJ2 ?? Pacific Page 2.54 appears
to be a low cost alternative. Retail cost os $695.00. Ram requirements are
2.5 meg. This product is reviewed in the Jan. issue of Byte magazine.
This product simply plugs into the one of the printer cartridge slots,
and is selectable through the standard printer controls.

IBM does not make Apple software, Commodore does not make IBM software,
Apple does not make Atari software, Hewlett Packard does not make
C64 software, but Atari makes Amiga software. Atari is just wasting
time and enegry that they could use elsewhere like fixing bugs, updating
computers and bringing out software for their *own* computer systems.

>Pascal (probably by some structured programming fetishist) I suspect
>that most of the code is pretty awful.

What makes you think the "code" that apple has written is awful? Just speed?
In that event (no pun), the Mac's of new (SE 30, cx etc) are MUCH faster than
any ole' ST in "raw horespower". But, a Mac + clocks at some 7.xx mhz, not
enough for a noticable difference. In disk i/o, there is a definite advantage
in the ST as DMA (direct memory access) is applied to the task. Screen i/o?
The MAC is doin' a WHOLE lot more work than is "visible" to you. And is as
well MUCH more versitile in what can be done. In that "128k of rom" are over
800 functions. Did you know the Mac has fixed point built in to the rom?
Did you know it has a float library in rom for dealing w/ tiny float values?
+ or - 2 to 30 decimal places. Did you know it has a VERY handy clipboard
for use w/in virtually ALL applications?. Did you know the O/S is extensible?
Da's TRULY multitask. W/ Multifinder, the whole machine multitasks (cute too!)
Apple is supposed to release System 7.0 shortly, which, supports virtual
memory (w/ HD's, over Appletalk etc) and a TON of other features. The Mac
as a "whole" is just a fascinating little gizmo! My only beefs w/ apple is
pricyness (which atari has emulated in the Mega's), and lack of "cheap" color.
(although I'd imagine that'll change too shortly). In adition, the Macs one
of the few "real" games in town. It's widely used in buisiness, it has GOBS
of software available both commercially & Public Domain (over 2 gigabytes
easily PD). Still thats Penuts compared to IBM. It would seem your bashing
a machine w/o exactly knowing any facts. I love my atari, its a fascinating
box. But, realistically it is not in the same league as PC's, Mac's, and
recently Amiga's too. Don't be blinded by names & jargons, but, if you must
at least pick a name that beleives in the computer user.

Message-ID: <2365@sactoh0.UUCP>
Source record: 245091

Look, I won't mince words. I don't mind constructive critisisms or at least helpful suggestions on Atari, but when I see crap like "since Atari is publishing for other systems, it means their own computer flopped" ad naseum, I have to put my foot down. I have pretty much put up with it before, but seeing it more and more, and not seeing anyone respond, I will say something about it.

Atari is not perfect, but then again, Commodore is not the shining star of the computer world. Each has it's drawbacks, and of course, it's advantages. But to see people harp on something, while simultaneously proclaiming their system to be able to slice bread, well, I see it as a pile of bull, and will say something about it.

If you love Commodore, then that's your perogative. But this *IS* comp.sys.ATARI.ST, not amiga, so leave your Amiga (or Pied Piper, or Franklin, etc.) proclamations in the appropriate newsgroup.

Hello back in the nineties,
a few querstions for today:
1) Is is possible via soft- or hardware to kill the black frame of the atari sm124 monitor?
2) Is it posible to alter the waste paper basket of gem in the way that you can open it again like on the mac to unerase?
3) Can somone tell me where to find other computer newsgroups in the net and a few ideas:
1) The mouse cable can be repaired with little money. Ask your dealer to measure what doesn't work and then built a new one for of course 5 dollars
2) There is a german TEX running much faster than the pascal one cause it's in C. It's possible to run on a 1040er with only one drive, but for instalation you need two drives.
Think it's enough for today, so let's say bye bye. If you know something of interest please email to so01@dmarum8.bitnet.
Thanks in advance
Thomas Neser

Smile when you say "amateur programmer". Sure, I don't get paid for what I do on the Atari ST in my spare time. However, I do get paid for developing software on the PC during the daytime. A lot of people fit that category.

Let's face it, most of the companies developing software professionally in the the Atari market just aren't very large. There are probably a number of programmers who would like to develop software in the their spare time, and turn it into a business later -- one just as large as any currently supporting the ST. (Sure, most of them are dreaming, but a number of companies have been started by boot-straping.)

A part time developer has a choise: develop on a machine which has all the information available for $30 at any computer book store, or $300 for a stack of photocopies from Atari.

Phoowie! The only way I can get simple information on memory locations is to become a developer, because anyone else who has the info isn't allowed to tell me.

So I can spend $300 U.S. on a giant stack of poorly organized ... stuff. And after spending that, maybe I can write some software in my spare time (I develop software for the PC at my job) that will garner a few bucks, so long as Atari doesn't go down the tubes in the next year.

Forget it! I'm spending my spare time developing for the PC. My development tools are much better, and I don't have to pay $300 to be let into the boys' club, and be told the secrets -- which I have to promise not to tell anyone not in the club. I really do hope that Atari smartens up, and creates a new support class short of developer. (A CHEAPER class -- I don't plan to spend $300 on photocopies.)

Flame off!

Hi , it is me again .

Since STE hardware allows 'hardware scrolling' by setting some video registers,
I wonder whether the STACY with its TOS1.4 has got the same capability ?

Any idea ?

It would be nice to know a bit more about it before I buy one.
Thanks.

102. Re: media change problem with Toshiba drive

>> is removed once it always appears write protected.
>>
>> 1) What is the media change signal really supposed to do?
>> I guess that really is, what does Atari expect it to do?

The ST does NOT use the 'media change' signal (aka the 'disk inserted')
signal. It expects the 'write protect' signal to be asserted when a disk
is removed and uses that to decide whether the disk might have been
swapped.

Chinon drive mechs (some models) had this problem. The cure for the
affected Chinon mechs (which I'll describe in case it helps find a fix)
is to open the disk drive and have a look around. (KEEP YOUR GREASY
FINGERS AWAY FROM THE DISK HEADS AND ACTUATOR.) The mechs had two
adjacent and identical push switches. One was the write protect
switch, pressed down when you insert a disk with the protect window
closed. Next to it was the 'disk present' switch, pressed down when a
disk is inserted. (You can see which is which by putting a disk in
while you've got the mech opened up.) The cure was to put a jumper
across the pins of the 'disk present' switch, so that the drive always
thinks there is a disk in. Those mechs only report 'write protect' if
there is a disk in -- if they always think there is a disk in, then
'write protect' does the right thing when there isn't one. (Sounds to
me like, for your mech, you'd need both to nobble the media-change
diode, and the 'disk present' switch.)

NOTE -- This worked for me. That does not mean I guarantee it will work
for you. If you even THINK about opening the case of your mech, on your
own hands be it. Good luck.

104. 1040STE, at last!

Newsgroup: comp.sys.atari.st
Date: 1990-01-05 14:43:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <9001060801.AA03913@ucbvax.Berkeley.EDU>
Source record: 245098

Well, I finally received a 1040STE; two months later than promised but it
did come in. While I have only had a few hours experience with this computer,
I have some comments and questions.

1. Why can't Atari develop some marketing skills? The STE with purported
enhanced graphics does not come with a demo program that illustrates
those features. Geez guys, supply a demo graphics/stereo sound program
to show off the STE's capabilities. The system came with an ORIGINAL
1040ST manual and an addendum sheet - nice touch for a new flagship for
the new Atari Corp!

2. When a Save Desktop is executed in med. res. on a 1040ST and the system is
booted, the system comes up to a med. res. desktop. Could not get this to
happen on the STE. Why not? This system woud only boot to low res.
No mention of this in the addendum sheet.

3. As far as I can see, no hardware clock. Unbelievable!

4. On the plus side, yes Virginia there is a Blitter!

The following codes worked:

PC Ditto (version 3) *** this is not PC Ditto II ***
Art_ST version 2.3 (a PD version of Degas)
LDW
HiSoft Basic
UNITERM
SuperBase Pro version 3
WordPlus 3.14
Bently Bear Magical Math I

The following would not even load in (note, my auto folder was bare and
not .ACC were active for these tests):

NeoDesk 2.05
Drafix
Word Perfect (1987 version)
Bently Bear Memory Master
Speller Bee

The following would not run from my auto folder (activated after the
tests on the software listed above):

Pinhead
UIS II
Headstart

Just as an aside. A local user wants to attach an Atari 64K to his
SC1224 monitor. Is there a cable available to do this?

105. Re: Aerco 4 Meg ram upgrade boards

+>goto 4mb you have to rewire the bank that was set up for 256kb chips).
>
+>dgc

Ooops, I should have been just a little more specific... I was having problems upgrading to 2.5 meg. A little local help here let me know that upgrading to 2.5 meg requires pulling out the existing chips. I was under the impression that the 2.5 megs were all on the upgrade, not split between the upgrade and the main board.

The package I bought contained the board (with 1/2 meg installed), a floppy with two ram test programs, a multi-page photocopy showing how the board was to be installed, and a 2.5 foot length of dental floss (to tie the board in place!!!). It did not contain any documentation on upgrading to 2.5 meg, any documentation on upgrading to 4 meg, or a lifetime subscription to PC Magazine.

Since I now have 2.5 meg running, could anybody send me info on how to go all the way (or do I have to figure out which traces have to be cut

and which jumpers have to be soldered in myself?).

Last question: does Aerco still exist as a corporate presence?

John

107. Some Fundamental Dungeon Master Questions

Newsgroup: comp.sys.atari.st
Date: 1990-01-05 16:35:37 UTC
From: sutherla@qtp.ufl.edu
Message-ID: <844@orange9.qtp.ufl.edu>
Source record: 245201

I asked questions similar to these in rec.games.misc about
3 months ago, but the response was sparse at best. I am hoping that,
since Dungeon Master came out for the Atari first, that someone out
there has the answer to my questions.

What I want to know is: Has anyone made a list of all of the
items, in categories (armor, rings, weapons, staffs, wands, etc.), that
can be found in the dungeons, and, MORE IMPORTANTLY, what each of them
does that is special. For instance, I found a "Staff of Claws" but can
find no value in it.

Second, has anyone figured out if certain weapons are more
effective against certain opponents? For instance, I would assume that
a broad axe would be more effective against one of the "rock mounds"
(found on level 3) than a rapier. I find myself with so many weapons
that I have to choose which ones to keep and which ones to discard. It
would be helpful to me if I knew which weapons were, in general, more
effective. I know, for instance, that a vorpal blade works against
ethereal beings.

******* SPOILERS FOLLOW. DO NOT READ UNLESS YOU WANT TO SEE THEM. *******

I have a partial list of the items available in the dungeon. The
list is contained in a cluebook (actually more of a helpful strategy tips
book) called "Secrets of Dungeon Mastery". Just to give you a feel for
what I am after, I will include some excerpts from this book. Note that
the book entries are more detailed than what I really need.

AMULETS:
EKKHARD CROSS:
Named for a valiant crusader who came from another world
to save our own. Said to protect those holy men who wear
it and increase their ability to learn from their
experiences. (Only the latter part is important to me.)

I WILL ONLY INCLUDE PERTINENT PASSAGES FOR THE REST OF THESE ITEMS.

GEM OF AGES:
The natural MANA of the wearer is increased.

ILLUMULET:
(Tells where it came from, not what it does.)

MOONSTONE:
Increased magic and influence.

PENDANT FERAL:
Grants the wearer the agility of a field mouse and
the wisdom of a unicorn.

SPIRIT EYE:
Protects the wearer against magic.

THE HELLION:
Contains the powers of the universe and the ability
to combine magic, physik, and energy interchangeably
into any form desired. (Pretty vague about how it would
be used.)

RINGS:
STORMRING:
Create lightning.

EYE OF TIME:
Can stop time for all but those designated.

CLOTHING:
CLOAK OF NIGHT:
Makes the wearer difficult to hit.

FLAMIT:
A gauntlet which casts fire.

POWERTOWERS:
Greatly increases the strength of the wearer.

SPEEDBOOTS:
Greatly increases the speed of the wearer.

ARMOR:
ARMOR OF DARC:
Heavier than normal plate, but is among the strongest
armor known in the world.

ARMOR OF LYTE:
Lighter and better than plate, but not as good as the
Armor of Darc.

DEXHELM:
Increases the wearers prowess.

MITHRIL ARMOR:
Lighter than chain mail and stronger.

WEAPONS:
BOLT BLADE:
(No details given as to its use or effectiveness.)

DELTA SWORD:
Specifically designed as a thrusting weapon for ZED.

DIAMOND EDGE:
Very effective against armor.

FURY:
No specifics.

HARDCLEAVE:
One of the finest combat axes ever made, although not as good as the Inquisitor. Especially helpful against armor or hard bodied creatures.

THE INQUISITOR:
One of the finest-edged weapons in the world. Designed to allow BERSERK attacks, but also adds to the users MANA.

VORPAL:
Effective against ethereal beings.

CROWNS:
CALISTA:
One of the most important items to obtain in the dungeon. Those who have it may, by uttering the words found in the Book of Kran, obtain the greatest treasure in all the world.

CROWN OF NERRA:
Increases wisdom. (??)

LEGENDARY ITEMS:

HORN OF FEAR:
Rumored to frighten creatures into flight.

MAGNIFIER:
Calls down the power of light and brings fire into being where none existed before.

MIRROR OF DAWN:
The light of day beams from its surface and its reflection is effective against ghosts and their ilk in the depths of the dungeon.

STAFFS & WANDS:
DRAGONSPIT:
Absorbs the flames from a dragons mouth.

SCEPTER OF LYF:
Limited healing properties.

STAFF OF MANAR:
Attacks elemental ant ethereal creatures and ward off damage.

TEO WAND:
??

THE CONDUIT:
Calls down the power of the storm and allows one to see
past solid objects.

YEW STAFF:
Twin staff of the Staff of Manar. The Grey Wizard has it.

I have NOT found most of these items yet. (I'm on LVL 9). I have found many other items not included here, such as the Staff of Claws, and many more mundane items (rapier, several types of armor and helms...). These are NOT special, but it would be nice to have them "rated". I HAVE FOUND NO INFORMATION, OTHER THAN THE LITTLE PROVIDED ABOVE, CONCERNING THE EFFECTIVENESS OF CERTAIN ITEMS ON CERTAIN CREATURES, OR TYPES OF CREATURES. Information like "The Hardcleave is effective against armor and hard bodied creatures" would be most helpful.

Sorry for the length of this article, but I hope that it gives some idea of what I am looking for. Any help would be appreciated.

BTW, I have heard of a ClueBook for DM which has a purple cover. Has anyone seen this? Can you describe it? Does it give TOO much information, or is it given at various levels, so that you can decide for yourself just how much of a hint you want (much like the Infocom cluebooks)? Does anyone have one that he/she would like to sell?

Thanks,

Scott Sutherland

> >
>well, at terminator.cc.umich.edu in atari/new directory, there is a file
>called LHARCSRC.arc which looks like something worthwhile to look at...

There are clearly sources floating around, but I think that Grimm's
posting referred to the portability issue. I have the LHARC sources for
MS-DOS, and they are mostly in assembler. I use LHARC for distributing
MS-DOS software and I think it has some really great features, but not
being able to run it under Unix is a tremendous inconvenience for me.
This is probably true of anyone who runs archives on different kinds of
computers.

By the way, i haven't been using the ST version of LHARC, but the latest
MS-DOS version, 1.13C, is super, especially with regard to compression
ratio and the flexibility of self-extracting archives.

Actually, Lynx(s) have been shipping for quite some time now, well
before Christmas, to New York and Los Angeles. You could have called
the Sears mail-order catalog and ordered one, if you don't live in
those areas... Also, I hear that two Bay Area stores got a shipment
apiece...

I'm not against Atari writing software for other platforms, and I don't think it signals the "flop" of the ST. However, Ian makes a good point. Atari is a small company and has limited resources. I too would prefer that they devote their energies to the support of their current line and the development of future products. I believe that would be of greater long-term benifit to Atari than insuring that the Amiga has an an authentic port of Gauntlet...

BTW, who is "RJ Michal"?

This is my first post, so a fancy signature will have to wait. Happy New Year, everybody!

>computers and bringing out software for their *own* computer systems.
>

No, but Infocom makes software for the IBM. And the Apple. And the
Atari(s) etc. If you are talking about the software portion of Atari, you have
to compare with software companies. Conversion of software is a sound
business idea.

If your complaint is that you don't think Atari should make software,
fine. That's a marketing decision they made that is different from yours. If
they are going to produce software, it's silly not to make all the money from
it that they can, and conversions are cheap compared to licensing/developing
new software.

(Infocom may seem a poor example, since I believe they just decided to
stop producing for Ataris, but you get the idea anyway.)

I experienced the same symptom with my Supra 20 drive and have since discovered that it is a feature of TOS 1.4 that prevents one from booting off the internal floppy while the Supra autoboot feature is installed. I just boot my ST first and then my hard drive and run the Supboot program.

In article <2009@sbsvax.UUCP>, roeder@sbsvax.UUCP (Edgar Roeder) writes stuff about using the terminate handler.

This "hacker's approach to terminate handling" is one of the scariest things I have ever seen. The terminate handler is meant to let you restore state which you might have changed before you terminate. It is not intended to let you off the terminate hook, so to speak. You should always return normally from a terminate handler, using rts. If you don't want ^C to stop your program, you should not use cooked GEMDOS calls. If you don't want a bus error to stop your program, you should install an exception handler of your own. The terminate vector just isn't meant for these things.

Correct usage of the terminate vector includes calling BIOS to restore the state of the screen and keyboard, un-installing vectors like timers and interrupts you've installed, and the like. You can't make GEMDOS calls from inside a terminate handler, or call something which might make GEMDOS calls, like flushing output streams or even closing workstations which are really metafiles.

I use terminate handlers in graphics programs which change the rez or palette: the terminate handler changes back to the original rez and palette. Doing other stuff is asking for trouble: most especially, you will die horribly if run under MetaDOS or some future multi-tasking TOS. (MetaDOS is a filesystem call dispatcher placed between user programs and foreign filesystems like CD-ROMs and (eventually) networks.)

Please, please, just use the terminate vector to clean up after yourself and RTS, and save yourself the grief later on.

(By the way, the original article has the wrong address for the terminate vector: it's at 0x0408, not 0x0400. The exception number, 0x0102, is right.)

This is conviently taken out of context...

No, what I was reporting here was that people who brought the topic
up on the RT discussion (and there were not that many) said they were
afraid of saturation of the section the material was being posted to.
They were talking about it as though they had already made use of the uplink
information. If they had, or if they hadn't but just said they had
I have *no idea.*

Once again...my little one paragraph comment was intended to briefly
report on what I had heard on that discussion. I was at that discussion,
you, Chad, were not. It was an informational paragraph for the benifit
of USEnet users who did not have access to GEnie. I did *NOT* intend
this to be a harange on *me* as to the validity of what was or was not
said.

Enough?

>You said Atari ST section which heavily implies the Atari ST RT
>

Give me a break....play semantics on your own time. If you *knew* I was
referring to the Gadgets RT, then why bring any of this up? To show
that *you* knew the difference?

124. How to call the bios from within process termination handlers

Newsgroup: comp.sys.atari.st
Date: 1990-01-06 04:49:44 UTC
From: dmb@TIS.COM
Message-ID: <9001060449.AA23484@TIS.COM>
Source record: 245218

The original thread was about changing resolution from within a process termination handler (i.e., a function installed at the GEM process termination vector 0x102).

Atari's Allan Pratt claimed that you can call Setscreen from within such a handler. He was indeed correct. (I was a bit skeptical after the 36th crash, but now I Believe.)

HOWEVER, my frustrating attempts to get this to work indicate that the OS hooks are different in his compiler than in Sozobon C. Calling Setscreen with Sozobon's standard xbios() call will cause an exception. I.e., adding *just*

```
Setscreen(-1L, -1L, 1);
```

to my process termination handler causes the handler to RTS to an illegal instruction. Note that this call is #defined in <osbind.h> and turns into

```
xbios(5, -1L, -1L, 1)
```

(i.e., it calls the xbios hook in dstart.o, provided with Sozobon).

For the hell of it, I tried writing my own xbios hook, assuming Sozobon's stack checking was causing the problem. It wasn't the stack checking. (At least, that wasn't the only thing.)

Saving the stack pointer before the trap and restoring it afterwards fixes things. I don't know why the bios trashes the stack when called from a termination handler. Perhaps a wizardly Atari person could comment.

Also, I'm wondering if dstart.o is in error for not saving the stack pointer, or if Atari is in error for writing bios code that trashes the stack pointer, or if somebody else is in error (maybe me). (Well, _somebody_ has to be in error! Who can we flame if no one's in error?)

In any case, anyone who's having trouble getting bios calls to work from a termination handler (and I believe this is a problem in Laser C as well) should try using the OS hooks below. They work with Sozobon, and as far as I know should work with other C's too.

I certainly hope that no one thinks that is a reason, if any, why Atari decided to use a particular board.

A kludge? Bad chips? Are you certain? Because you use the words "my theory", it is just speculation on your part, and I'd like to make that clear to the other users here.

Maybe you're right, but maybe not.

Microsoft makes software for other systems, Word Perfect makes
software for other systems. What difference doers it make, if a
hardware manufacturer decides, through a subsidiary, decides to
publish software?

My main argument stands. If Atari can make money publishing for
other systems, what is wrong with that? If you think that a
hardware company must for now and forever, be a hardware company,
and only publish for it's own system, then sell your Atari, if you
have one, and get the competition. Apparently, they are, and do.

But if Atari can diversify, and expand into other areas, then more
power to them. Geez, even the auto companies have other interests
other than car manufacturing, look at Mitsubishi (aircraft,
computers, consumer electronics, banking, etc). What have you
against Atari expanding into publishing?

Hello netters,
i think it would be nice to have a catalogue of software and where it is running, i mean on which TOS, or with software of mac or ibm or cpm as well on which emulator it will work. If some people work on this case we can get fast a good database of a) programs running on the ST and b) where they are tested. If you think that it's a good idea we can work together. Of course later on you can easily see from that datbase what a program does or what it cost is. I saw an older gem-bug-report in finnland and it would be usefull to have a newer one and of course more.
E-mail appreciated to so01@dmarum8.bitnet.

Maybe, but just take one look at the tiny amount of software that
supports this hardware when compared the the rapidly growing Amiga
libaries, and you might change your mind rather quickly. :-)

> - Mac II (provides 16 million simultaneous colors).

Whoa there. Yes, the Mac II has a 16 million color palette, but the
output only handles 256 colors simultaneously, not all 16 million.
^^^
Yes, you may be able to expand this capability, but it will cost you
a LOT. Heck, the basic Mac II will cost you a lot too, so you may
not have the $$ available to expand to the kind of colors you want.

Hi there...

I use Uniterm 2.0e quite a bit. It has very good vt200 emulation, as well
as others. It has kermit, xmodem, and ymodem downloading. I haven't
been able to find a terminal program that has zmodem for the ST, but
there is a pretty good zmodem shell out there. Both Uniterm and Zmodem
1.8 are PD, so that fits your bill.

Me, all I want is to get UW (unix windows) to work.

Wait until the floppy drive light goes on, and THEN hit Ctrl-Alt-Shift. This
will override the hard drive boot and boot off the floppy.

This was also the same with TOS 1.2. It holds true for ICD software as well.

(wonder if my .sig file will work)

From: 01659@AECLCR.BITNET
Message-ID: <9001070800.AA18215@ucbvax.Berkeley.EDU>
Source record: 245228

A local user has just purchased Timeworks DTP and has a STAR NX10. Obviously, the default Epson 9-pin driver is not compatible with the NX10 since a form feed at the end of a DTP page throws the page alignment out for subsequent pages. Does anyone on the net have an NX10 driver for Timeworks DTP? What about Publish IT for the PC (this is DTP ported to PCs under GEM).

The user wants to crank out a newsletter ASAP so a quick reply to this request would be greatly appreciated.

Thanks in advance, Greg

After reading several descriptions of TOS 1.6, it sounds like it would not be an impossibility to drop a 68030 into a 1.6-equipped machine. Will Atari market 1.6 to us 1.0-1.4 peoples for that purpose? I like my Mega and do not plan on upgrading to an STe (for the same reasons that I sold my 1040). I realise that this is not exactly an easy question for those Atari employees on the net, as it is more a legal issue than a technical one =:(

In article <9001030805.AA24416@ucbvax.Berkeley.EDU>,
so01@dmarum8.BITNET (Thomas Neser) writes:
> Hello netters,
> does anyone know something about the use of coprocessors with PC-emu-
> lators? a) The co-processors in use with the atari 68000er

I was VERY INTERESTED in attempting to tack a mc68881 co-processor onto
my 1040.....I talked to ATARI-US and ATARI-UK: They couldn't tell me
ANYTHING and ATARI-US denied the '881s existance.

In a UK catalog, however (Silica House), I do see the co-pro listed as an
ATARI-manufactured item! Although this is most certainly NOT the case--unless
someone isn't telling me something.

* IMPORTANT INFO ... CUT HERE !!! ******************

I DID call Motorola in Illinois and explain my problem to them.
The end result was that in one week, they sent me:

"Motorola SEMICONDUCTOR Application Note : AN974 ;
'MC68881 Floating-Point Coprocessor as a
Peripheral in an M68000 System' "

[the important part is the "AN974"] :-)

Call them [sorry, don't have the number on hand]
via directory assistance...

OR WRITE TO THEM AT: Motorola
Semiconductor Products, Inc.
Suite 700
2300 North Barrington Road, Hoffman Estates
ILLINOIS 60195

They were VERY responsive; The "Applications note" is a 41-page
document CLEARLY WORDED and INCLUDES SAMPLE 68000-ASSEMBLY SOURCE
CODE DRIVERS!!!: EVERYTHING SOMEONE WITH A DECENT ELECTRONICS BACKGROUND
COULD EVER WANT TO KNOW ABOUT THE CHIP-- Charts, diagrams, pinouts,
etc... are given. My biggest problem is that I wish I had enough
time to get used to 68000 machine code {this VAX drives me nuts}.
The source code has about 15 pages!!!

This should keep someone busy for a while.

Sheesh, another commode head. When are you guys going to realize
that Apple is the enemy, with the lion's share of the pie, whilst
you split hairs over the crumbs? Pointlessly for your information,
there has been an EXCELLENT line of gen-lock software available
for three years now. Yeah the amiga's a little better, but it
costs more too. In fact, at the price of the 2000 fully equipped,
I'd put out the rest of my non-existent wad and buy security with
the Mac II.
I develop on both machines.... They're both great, but neither
one is better overall. All I know is that PC's suck, period. :)
Too bad you can make such a killing off them though...

Well Atari may be a relatively small company (though recently (year ago?)
listed as a Fortune 500 company). And I agree that I would like them to
support their current line and develop future products. But in the state
they're in right now having recently come out with quite a few new products
and working on several more, and establishing new inventories I'll bet
they're pretty short of cash.
Developing software ports for other computers seems like a pretty cheap
way of getting some extra profit to spend on supporting their current line
and developing new products (if that's how they use the money).
If they can make some quick cash from it, maybe we'll even see the TT
sooner. (Long shot, I know.)

Ok I will, it did come out in time for Xmas day, NYC got it and 60% of the noise
on Rec.games.video is about this GEM, supposedly LYNX's sold like hotcake
everywhere because of coverage and commerical(*WOW*) In the metro area everyone
should have seen Lynx commericals on TV, I know I have seen them more than once.I guess its
good but Atari stock has been sliding for a while from it 52 week artifical high.

>Now, could someone at Atari tell me why it works, and why the old method
>(just the keys) doesn't?

I could be wrong, and this is just my own experience, but I think (??)
that Supra is wrong.
I have TOS 1.4 in a Mega2 that was upgraded to 4 meg of memory. By
allowing the light on the floppy drive to flick on|off then pressing
the <CNL><ALT><LEFT-SHIFT> key, then I can boot off of my floppy. Whether
the floppy has programs in /AUTO/ folder or not, the floppy will take
priority. No partial removal of floppy--nothing.
This is with the ICD 4.x software, by the way. Maybe Supra hasn't
upgraded yet or something.

SoftLogik sells a new manual for PageStream 1.8 for $15. The complete upgrade for PageStream 1.5 owners is $25, $10, w/o the manual. Dealers are authorized to make copies of their 1.8 upgrade upon proof of ownership.

I have at least 16 public-domain fonts for PageStream, and another 30 that I bought from several companies.

The public domain fonts are available on Genie, CompuServe, and on SoftLogik's BBS.

>
Yeah, that would be great; but I'm beginning to wonder what, short of divine intervention, would give us the TT anytime soon... :-)
Unfortunately, given Atari's past methods, it seems to me that their "software arm" would be spun off from the main company to make its own money. Any profits would probably stay inside that division, rather than being used for ST/TT development. I'm not a business expert, and don't know the straight poop about Atari's organization, so I could be dead wrong. That's just how it looks to this layman. Would anyone in the know care to comment?
Hopefully we won't be seeing any Atari U.K.-type flames about the New Atarisoft... (}~:

Steve Plite <splite@mtus5.bitnet> I disclaim that I have any opinions.

144. Atari's Quarterly Results ($5.4 Million Lost) :)

Newsgroup: comp.sys.atari.st
Date: 1990-01-07 08:49:27 UTC
From: rohwerwd@csusac.csus.edu
Message-ID: <1990Jan7.084927.19588@csusac.csus.edu>
Source record: 245238
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

The following is from "The Business Journal", p. 28, for the Week
of January 8, 1990.

"Atari Corp. of Sunnyvale suffered a third-quarter
net loss of $5.4 million, or 9 cents per share, on net sales
of $81.44 million. During the third quarter of the year
before, the company earned $900,000, or 2 cents per share, on
on net sales of $98.8 million.

"For the nine-month period ended Sept 30, Atari had
a net loss of $1.78 million, or 3 cents per share, on net
sales of $252.96 million. It earned $12.14 million, or 21
cents per share, on net sales of $299.64 million during the
comparable period for the previous year."

Apparently, Atari is slowly fading into oblivion. :)

I don't read these newsgroups, so if you want to contact me, then
you will have to email messages to me.

RE MWC 2.0
Help! I'm trying to struggle thru the intro of MWC 2.0 instructions. I'm used to being coddled by text books presenting things in order, more-or-less, and find myself quite lost in msh\pathnames\libraries\foo.bars.
The question: Do any of the other compilers (Laser/Prospero/MWC 3.0) present things any better? After 1 semester of C, I'm trying to apply it on the ST...I'm sure I'll learn lots but the presentation of msh in 2.0 is making it more painful than I think it should be. Any comments helpfull here.
Thanks..... j harris \fairbanks\alaska

The program ZMDM (now in version 1.6) by Bammi and coworkers at Case WRU supports Y and Zmodem. Although I have UniTerm and think that it is a great program, because of its size and complexity I use it only when I need the graphics support. The new version of ZMDM has the feature that you can install it as an application and run it by just clicking on a small file containing a phone directory. I have been using ZMDM for years and find it virtually bulletproof (I had to make a minor hack to get it to support pulse dialing, but that is my only problem). It is not a GEM application, so you can run it from a shell too.

It is also worth noting that while Wall Street is in a frenzy right now and most stocks have gained in value, Atari's has just sat there. I still remember looking at the Quotron on my desk after Jan. 1 and seeing the market go through the roof while Atari lost about 1/2 point. I'm not saying that this has much to do with their policies in their computer division (Gads, if that was the case the stock would be at 4 1/2 again), but just reflects an overall trend of poor capital management. Just my $.02...

From the depths of Wall Street...:-)

From: paul@cacilj.UUCP
Message-ID: <1360@cacilj.UUCP>
Source record: 245249

I'm trying to add a scrollbar (slider) to allow a long text description to be partially displayed in a form. I've written several programs using forms, but windows are new to me. I can figure out a kludgey way to superimpose a window over my form, but that's about it. I'm looking for something like the item selector, where a scrolling window peacefully co-exists within the form.

Even if I could kludge together something that *looked* good, I'm not clear on how to use it once it is created. I need to use form_do to read the form, but also need evnt_... to read the window. How can I do both? Do (can) I use the G_PROGDEF type briefly mentioned in the MWC docs? If so, how?

Finally, I can't find any functions for writing into windows. Do I just write to the screen inside the window? It seems like a window is just a way of managing a mini-screen. I was hoping there was an object that would allow for scrolling fields. I also wonder about all the "home-brewed" windows I see in applications. They look like GEM windows, but have more buttons and fields than GEM windows. Is there a "window toolkit" buried in the AES or VDI somewhere?

Questions, questions, questions. Thanks to those who reply,

>I noticed that the address has changed to archive-server@panarthea.sun.com
>(no more .ebay.), although I haven't seen a posting to that effect.

Are you sure? I just tried sending test messages from two different sites,
and panarthea.ebay.sun.com worked in both instances. An alternate address
for the server is archive_serv1@ebay.sun.com (I didn't set that up -- the
local mail people just want to have addresses for everything on the mail
gateway machine.)

>I have a baffling problem with it -- I can get it to send help and
>indices, but it never sends the binaries I request. I've tried to keep
>the size of the requests small. Any ideas?

Are you sure your requests are in the proper form? A very common mistake
is to say

send binaries/volume1/foobar

instead of

send binaries/volume1 foobar

The archive server chokes on the first form. The form of requests is
"send directoryname file [file file file ...]."

Actually, I have seen such a board advertised in a catalog by Global Computer Supplies. (Sorry, I don't have the address.) Of course, that may not actually mean that they have it.

Sure you can get Tos 1.4 Direct from Atari Canada for 100 Canadian. Thats better than 180. Call 1-416-479-1419.(Service Department) in Markham Ontario. I got mine via Mail and installed them myself! They even include instructions for two chip Mega Rom Versions. Anyways put it on Visa and order direct may be even cheaper in the west to go through Atari California

^^^

You're dead wrong on this one. The Mac II series does provide for 16.7 million colors. Whether you get it or not depends on the video display board installed on the Nubus. In front of me is an ad from Radius for their DirectColor/24 which can simultaneously access every one of the Mac's 16.7 million colors. They also make a 16-bit board (32,768 colors simul-taneously) and 8-bit board.

>Yes, you may be able to expand this capability, but it will cost you
>a LOT. Heck, the basic Mac II will cost you a lot too, so you may
>not have the $$ available to expand to the kind of colors you want.
>
> Kurt --

What do you expect to pay for such capabilities? Peanuts? But, seriously, there is so much competition among third party suppliers that the prices for these boards are bound to come down significantly.

These boards are not expansions, but rather alternatives to Apple's color display. They do not need an Apple video display board to work, but the nice thing is that they could work together. Mac OS provides for that.

Hi there, Greg. I saw the words Timeworks DTP, and I just had to talk about my own experiences with it. I purchased Timeworks DTP a while ago for about 100 dollars. I'm a journalism major, so such a thing is useful to me. Well, I opened the package and the disks did not work. Something may have been wrong with file pointers or something, but all the disks except the sample art disk were corrupt. Not much use, huh? Since I purchased the program, I figured I could get Timeworks to send me disks taht worked. I talked to a rep, and they said they'd send me the disks I needed. I got one that I needed. I called again, and they said they'd send me something, but gave me a real hassle about it and they never did send anything. I returned my 100 dollar paperweight to the store I got it from, luckily they were nice enough to take it back. Is the product support at timeworks ussually like this, or did I just get a bad experience?

165. Metafile problem

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 02:49:05 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <3710@jarthur.Claremont.EDU>
Source record: 245009

Hi, I am writing a graphing program with Laser C that creates metafiles for high resolution output. I am using the OUTPRINT.PRG program from Easy-Draw to print out the metafiles. When I try to specify the size of a font using vst_point(), it looks great on the screen, but when I print out the metafile I create, it always prints the font very small. I am not sure what the size it, but it is the same every time. If I use vst_height, it prints out larger fonts, but I can't get exact point sizes, so the fonts are scaled and don't look very good. I am using NDC coordinates. Everything looks great when I create Metafiles with Easy-Draw the output looks great. I am using the Epson 24 pin drivers from easy draw to print stuff out. Does anyone know what is going on? Also, how can you print to the printer directly? When I try opening device 21, it just ejects a empty page.

Thanks

Dan

Umm, drawing upon (notoriously unreliable) memory, I have the impression that Metacomco aren't doing Cambridge Lisp any more. They used to supply an ST version of a C compiler which has been picked up since by Hisoft in the UK. I will ask them if they picked up the Cambridge Lisp distribution as well. Hisoft are a good quality outfit, they are (sole?) distributors (importers?) of the Spectre GCR in the UK. I'll pass on the details when/if I get them. Anyone else who is interested in the current state of Cambridge Lisp, keep an eye on responses in the notestring.

From: kev@ist.CO.UK
Message-ID: <2575@istop.ist.CO.UK>
Source record: 245013

A colleague of mine (who doesn't use the Net) is shortly to move to the US. If possible, he would like to take his 520 STM with him but is wondering whether the cost of altering the (external) power supply would be prohibitive. The daisy-chaining of floppy drives would also be useful.

Therefore if anyone has any information on whether the alteration is possible and, if so, what's required, we'd appreciate hearing from you. If someone has succeeded in the past then so much the better.

Any replies to me and I'll pass them on.

Ta,

173. DEAD ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 14:29:27 UTC
From: sie@fulcrum.bt.co.uk
Message-ID: <WMLKD^@masalla.fulcrum.bt.co.uk>
Source record: 245016

I have been trying to fit an expansion into my atari ST 520STFM.
I de-soldered all of the holes, soldered in the sockets, soledered in
the 16 capacitors, and added the three resistors. I then checked the
ST only to find that it won't boot. I have since removed the sockets and
the capacitors and the three resistors, but still no boot.

I have had a hunt around with a logic probe and all seems to be functioning.
The only thing that I did notice is that the 2 of the 3 extra lines from the
MMU are being held high, whilst the third is pulsing in much the same fasion
as the original 9 lines. Does anyone know if these two lines from the MMU
should be held high or if they should be pulsing.
I have been advised that this is probably a solder wisker between two address
lines or two data lines or between an address line and a data line. I have
searched for this but have had no luck.

The processor will sometimes stop altogether, with its HALT line low. When
reset, it will go again for a while and then HALT. Could this be caused by
a sloder whisker ??

If this is wrong then is my MMU blown ??
I am talking abaout the MMU side of the resistors that go to the DRAMs.
The resistors are not in place as they are not in the standard 520STFM,
so these connections go the the MMU and nowhere else !!.
I beleive that only one of these three lines are needed to access the second
512K of RAM.

Any help here would be much appreciated.

174. ARC 6.02-bug (was Re: ARC 6.0)

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 14:40:12 UTC
From: ripley@tubopal.UUCP
Message-ID: <814@opal.tubopal.UUCP>
Source record: 245017

In article <CMM.0.88.631382411.cmm1@cunixa.cc.columbia.edu> cmm1@CUNIXA.CC.COLUMBIA.EDU (Christopher M Mauritz) writes:
]I've heard that ARC 6.0 is available for the ST. Where is it? Is it
]any good? Is it faster than 5.21? Enquiring minds want to know. [...]

It's just been posted to comp.binaries.atari.st
I tried it and I liked it. There are some things to complain on, though...

.complaining on

When I got arc 5.12 I've read that new compression methods will be
listed as "unknown" and can't be handled otherwise (naturally)... What I get
instead is a message "This version of arc can't handle file fubar.xyz. I
think you need a newer version of arc."... Not that this message is wrong or
shouldn't be printed, but WHY DOESN'T ARC CONTINUE TO DO ITS WORK BUT
IMMEDIATELY STOPS INSTEAD? If I do "arc v fubar.arc" and fubar contains
files which are squashed, I want arc to show me the contents of the
archive-file. If I do "arc x fubar.arc" I want arc to skip these
files such as "fubar.xyz - unknown compression method. Skipped.".
What I don't want arc to do is to abort the whole task.

This has been done by transitioning from arc 5.12 to wunderful(?) arc 5.21
with its squashing algorithm. This fault has been repeated on arc 5.21,
which can now be seen when listing an arc 6.xx archive which contains
sub-directories. Sigh.

.complaining off

Another one, which is more of a *real* (and heavy) bug:
Arc lost it's capability of dealing with overlong filenames.
That is, when I read news and save one or another article (under *NIX)
I sometimes use a name which doesn't fit into this nasty 8 char name
and 3 char extension -scheme. When I arc the saved articles afterwards,
arc puts them into the archive. When I list this archive with arc 5.12
the output format is mangled, but nothing else. Even with arc 5.21...
I have a Turbo-C port of arc (called tcarc), which has trouble in
displaying these entries... This doesn't matter too much, although it's
quite ugly.
When I list one of these archives with the recently posted arc 6.02,
it kind of crashes. It takes overlong time (far too much!), then it
displays entry corrupted, skipping xxx bytes messages !! The remaining
file-entries get displayed. On the last output-page with all those nifty
statistics, there are really weird numbers ! (How does an archive of
~200KB consisit of over 5 MB of data which leads to negative amount of
diskspace left on the drive the archive resides on ?)

This behaviour has been tested on at least 5 archives which contained
files with overlong names. It's highly repeatable, and if you often arc
on *NIX and often have overlong names, you'll often get annoyed with
this blatant bug !
Please, fix it asap !

Greetings,
RIPLEY

176. Status of codes on the STE

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 14:54:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <9001091510.AA13417@ucbvax.Berkeley.EDU>
Source record: 245019

When I checked out a new 1040STE, the following would not run

NeoDesk 2.05
Drafix
Word Perfect (1987 version)
Bently Bear Memory Master
Speller Bee

The following would not run from my auto folder (activated after the tests on the software listed above):

Pinhead
UIS II
Headstart

Does anyone know if attempts are being made to get these codes working with TOS 1.6?

177. Creating a file in C

Newsgroup: comp.sys.atari.st

From: jeroen@ruuinf.cs.ruu.nl
Message-ID: <2275@ruuinf.cs.ruu.nl>
Source record: 245020

```
I want to open a file in R/W mode and be sure that it is empty.
Here's how I do this now:

Fdelete(name); (1)
handle = Fcreate(name,0); (2)
Fclose(handle); (3)
handle = Fopen(name,2); (4)

It is remarkably slow. Is there a better way to do it?
If I leave out line 3&4, how does the Atari know I need R/W mode?
If I leave out line 1, won't there be two copies of the file?
If I leave out line 3, wouldn't I get two different file-descriptors?

Please reply by e-mail to jeroen@cs.ruu.nl
Thanks in advance!

In article <1363@atha.AthabascaU.CA> rwa@cs.AthabascaU.CA (Ross Alexander) writes:
]klute@trillian writes:
]>And another reason to use ZOO or ARC: There is ARCGSH
]>available, a program that lets you work with ZOO, ARC and other
]>programs from a GEM environment. [...]
]
]Arcgsh is the best reason I have ever had to install a shell (gulam,
]msh, any keyboard oriented line-at-a-time shell at all). Yes, I was
]using 2.1 and IMHO it's at least 5 times as much work to use as the
]raw commands themselves. Faugh!

As I think, both sides of the medal have their right to exist.

What do you get when running a CLI like Gulam to deal with archivers ?
You can communicate very direct with zoo/arc/whatsoever by directly typing
the appropriate commands as you got used on many other systems. It's
almost like invoking them from the desktop where you also type in the
command options, although most shell's capabilities (histories for example)
allow you a much more comfortable way to do your tasks...

What do you get when running a graphical shell like arcgsh to deal with
archivers ?
Mostly you get a lot of more comfort compared to a regular CLI. The way
you can address the archivers and invoke your tasks is luxurious !
On the other hand this cripples the user-interface a little bit. A program
like arcgsh can't have every command of those modern archivers. They're
just too complex. Even arcgsh with its menus (first choose your base
command then you get a list of possible options and so on) can't do this.
What you get by using arcgsh or somesuch is an interface to use the archivers
in a simple way, which accomplishes most standard tasks. If you're
getting more complex, you get too complex for them very soon. That's
the point when you grab your CLI to communicate directly with the
archiver.

Possibly you don't need this directness every time, and beginners
don't need every option too. If you're not very used to the direct
usage, you probably have finished your task with some clicks before
you remembered the appropriate command and the syntax for it.
Think of this, then think if it's worth it to complain about
graphical shells.

>you split hairs over the crumbs?
A/V Video, a reasonably decent trade publication that a friend has written for (TV*Text review for one), recently placed the Amiga at having a clear dominance of the desktop video market, based on reader replies. Somewhere in the neighborhood of 47%, I believe. Apple is currently slogging it out with the rest of the contenders. I would never underestimate Apple's ability to change this in the future, however. Also, take note of the "FM-Towns" that are currently the hot thing in Japan. NTSC compatable, with built in CD-V units. All they need is a reasonable operating system ;-)
>I'd put out the rest of my non-existent wad and buy security with
>the Mac II.
Currently, I believe the Amiga offers considerably more for the doller than the MacII, if you are interested in certain applications. It works well in non-broadcast enviroments (cablecasting is okay). You don't really need to spend $10,000+ if you are working with SVHS, or older 3/4" equipment, if all you want are titles, and simple animation capability. Believe me, there are a lot of people who fit into this catagory.

Depends. If they make a profit selling Amiga software, than that
profit can be channeled into Atari ST development, which is clearly
better than if they hadn't produced Amiga software at all.

steve> BTW, who is "RJ Michal"?

Actually, the name is RJ Mical. He is one of the co-designers of the
Atari Lynx, and also the principal architect of Intuition, the Amiga
user interface.

184. PageStream PostScript

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 16:45:57 UTC
From: silvert@cs.dal.ca
Message-ID: <1990Jan8.164557.24805@cs.dal.ca>
Source record: 245028

I've received several items of mail about my recent posting on PageStream 1.8, and one of the items which came up was failure to generate correct PostScript files. I tried this out, writing to disk and send the files to a PS Jet+, and I find that text files with just Tymes and Helvetica type come out fine, but Dingbats get turned into the Symbol font! I haven't tried to dope this out yet, other than noting that PageStream seems to download the character font rather than using the resident Dingbats (which makes for a huge file, over 50K for one page of Dingbats), but if anyone figures it out please let me know.

I did notice that with Publishing Partner I had to filter the PS file (the one with a *.GEM ending) to put it to a LaserWriter -- I think that the problem was the 0x4 at the beginning, but at least I could get the Dingbats and Symbols printed correctly.

Gee, MINE can show all 16 million -- I assume it's 16; my Control
Panel just says "millions." :-) The 256 figure is true for Apple's
Extended High-Res Display Video card.

>Yes, you may be able to expand this capability, but it will cost you
>a LOT.

Depends on what you mean be "LOT." Apple's card goes for about $450
discounted. The Raster Ops 264 I have was $796. So for only $350 more you go
from 8 bits to 24 bits.

Of course for the same $796 I can get an Amiga 500 and a few extra
goodies. As for my Mac IIx at work, I don't mind the higher price: I didn't
pay for it. :-)

What I'm pointing out is that 24 bit color is not so very
far from reach.

Extra Credit: How about putting an Amiga on a NuBus board and
sticking it in a Mac II?

Source record: 245032

Hi, Happy new year to everyone in netland just a note to make a point and to ask a question.

1) I cannot let the recent discussion on music composition progs go without mentioning Music DTP from Take Control (a British outfit). It is simply what it says real Music DTP, full typographical control, postscript and GDOS output, variable size text/music, full orchestral scores full page view etc. Most importantly the output is brilliant allowing the use of GDOS drivers. The postscript files produced are quite small too. However at the moment there is no midi (though they inform me that this will come soon). I think it is mentioned in Decembers Analog/ST-Log. I have been very happy with my copy and it is contantly under development.

2) There was some mail a short while back on refilling deskjet+ cartridges can people please send me any feedback on this practice and on anyother benefits/problems of using this printer on the ST.

thanks

Phil Woodall

189. Anyone know the format of a TOS executable's header?

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 18:34:35 UTC
From: timcc@csv.viccol.edu.au
Message-ID: <3963@csv.viccol.edu.au>
Source record: 245033

I am trying to write a program to dump the header information in a TOS executable, but have come across a problem.

I have two sources of information on the contents of this header, and they conflict.

Source 1 says:

```
1> /* GEMDOS executable file format
1> */
1>
1> /* CP/M-68K header
1> */
1> typedef struct {
1> int c_magic; /* magic number (0x601A) */
1> long c_text; /* size of text segment */
1> long c_data; /* size of initialized data */
1> long c_bss; /* size of uninitialized data */
1> long c_syms; /* size of symbol table */
1> long c_entry; /* entry point */
1> long c_res; /* reserved, always zero */
1> int c_reloc; /* size of data relocation */
1> } header;
```

while source 2 says:

```
2> /*
2> * output format for Alcyon 68K compiler
2> */
2>
2> struct head {
2> short a_magic; /* a.out magic number */
2> long a_tsize; /* # bytes in program text segment */
2> long a_dsize; /* # bytes in program data segment */
2> long a_bsize; /* # bytes in program bss segment */
2> long a_ssize; /* # bytes in symbol table */
2> long a_stksize; /* initial stack size */
2> long a_entry; /* entry point */
2> short a_rlbflg; /* relocation bits suppressed flag */
2> };
2>
2> struct more {
2> long a_dstart; /* address of data segment */
2> long a_bstart; /* address of bss segment */
2> };
2>
```

```
2> #define A_MAGICA 0x601A /* contiguous file with short format */
2> #define A_MAGICB 0x601B /* noncontiguous file, 'more' added */
2> #define A_MAGICC 0x601C /* as MAGICA, but data aligned on 2k */
2> #define A_MAGICD 0x601D /* as MAGICA, but data starts on 0 */
2> #define A_MAGICE 0x601E /* as MAGICA, but data aligned on 4k */
```

Does anyone know which is correct, or is there anything not covered by either? I would also like to know the function of the a_rlbflg field, mentioned by source 1. Surely this information is not "TOP SECRET HAND-KISSING DEVELOPERS ONLY" information? (Add :-) as required.)

(For all the Kopyright Kops out there: keep your hair on; the above information was not accompanied by copyright notices in any form.)

From what I hear, the current version (the one that just received FCC Class A certification) definitely does not. There are rumours that a future revision to try to pass Class B will have the STE chip set.

Tos 1.4 is like 1.2 in that there is only a short window in which you
can use the ctl-alt-shift "command". The best signal to look at is
the floppy; as soon as the floppy select light comes on, the keyboard
is set up and ctl-alt-shift can be used.

|>The thing I want to know about Atari, that NOBODY has been able to
|>explain to me so far, is why it seems to be ignoring the US? WHY dont
|>we have good advertising?

A very good question. I get the impression that they are being sabotaged
by stupid internal politics.

| I think the reason is just simple economics from Atari's point
|of view. The ST has had a much better selling rate in the European
|market; therefore, the demand for additional hardware and software is
|higher. Logically, Atari is going to spend most of its advertising
|and distrubution dollars where the demand is. This is unfortunate for
|US ST owners, but the company needs to do what it can to survive.

This seems rather short-sighted to me (nothing personal, Jason). I
believe that advertising in the US would generate substantial demand,
which, in turn, would justify the expenditure. Unfortunately, I don't
think they can start with a small investment. I think they need to
make a BIG splash in order to get attention and get into the market in
any serious way. I sure wish they would.

196. Atari-ST/printer/terminal for sale/trade

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 20:51:50 UTC
From: cyliax@ea.ecn.purdue.edu
Message-ID: <18740@ea.ecn.purdue.edu>
Source record: 245040
Cross-posted to: misc.forsale,purdue.forsale,comp.sys.atari.st

Subject: Atari-ST and misc. computer stuff forsale/trade

I have the following for sale:

Atari 1040 ST w/Monochrome Monitor $600
BMS-100 SCSI adapter & Western Digital SCSI Controller $100
10Mb & 30Mb harddisks + PS $200

Atari Software (all w/docs)
- WordPerfect 4.1 $75
- Minix-ST $50
- Mark Williams C-Compiler & Debugger $50
- Modula2 Development System $25
- Lattice C-Compiler/Assembler $20
- Spreadsheet & Plotting/Presentation Software $20
- misc. atari books (GEM, Internals ...) $20

All together $1000

NEC LQ thimble printer w/tractor and extra thimbles $200
Serial and Parallel interface

Wyse 30 Terminal $150

These prices are not cast in concrete/iron, so make an offer. I would
also consider trading for the following items:

- Multibus Unix Box :-) or boards
- Pentax 35mm Photo equip. (Pentax LX Body, lenses, etc.)
- Harddisk & Controller for Tandy 1400LT
- 6-8" Celestron/Maede Telescope (or a C-90)
- Telebit T2500 Modem

197. GNU-Emacs 18.55 Atari-ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 20:57:32 UTC
From: roeder@sbsvax.UUCP
Message-ID: <2056@sbsvax.UUCP>
Source record: 245041

Hi!

Now it is ready! The new version of GNU-Emacs 18.55 is posted to the binaries group. It is 22 parts. So if your machine has a small expiration time, you can start looking out for this package. The program will run on machines with 1 MB, but only if you are an absolute emacs fan. After a small patch you can get 200 kB free for editing on an otherwise empty 1040 ST (with gulam). I'll post now temacs and the binaries needed to produce a running emacs (18.55). The lisp sources and C-source diffs will be posted later. You may need more than 1 MB to dump emacs (i dumped it to a 500 kB RAM-disk on a Mega ST2) and the dumped executable is then 520 kB. What you get is a full port of GNU-Emacs enhanced with mouse-support minus processes (can't work without multitasking). The editor will start up in 4 seconds from a hard-disk (packed executable in 11 sec).

- Edgar

Here is the read_me file of the package and the contents of gnuemacs.zoo:

Archive gnuemacs.zoo:

GNU Emacs 18.55 Atari ST

1. Filename Syntax

All filenames inside of emacs use the unix syntax ('/' as directory delimiter). To specify a drive name you can either use '/dev/X' or '~X' where X is the drive letter. In the path replace all occurences of '\' with '/' (no slashes are allowed inside of filenames). As usual in unix '~/' means the directory '$HOME/' (HOME is an environment var).
Alternatively you can use the 'st-mount-drive' command to specify a mounting point for a specific st-drive. To access drive A: as /disk and drive C: as / you can do the following: 'M-x st-mount-drive<Return>' 'A<Return>' '/disk/<Return>' and the same for drive C. You can also write in your emacs.rc file: (st-mount-drive "C" "/").

2. Termcap

Emacs uses the termcap library. You can specify a terminal name in the env-var TERM (default is 'atari') and a termcap file or an entry in TERMCAP (default is '/etc/termcap'). The termcap entry (or the entry in the file corresponding to TERM) has the same syntax as in unix. A sample file is included. If you have some enhanced terminal emulator for the ST (for example the X_VT52.PRG) you can use its features (underline, colors). If you are using emacs over a serial line from another machine and you get a hangup (carrier high -> low) the program is finished (after an auto-save). The only problem with using emacs over a serial line is the number of lines and columns. They don't come from the termcap-entry but are read from negative line-A variables.

3. Environment Variables

You can set the environment vars with the 'setenv' command in your favourite shell or you can initialize it for the desktop with GEMBOOT.PRG. The lisp code of emacs is loaded from $EMACSLOADPATH (default is '/usr/lib/GNUemacs/lisp'). The documentation and info dirs are: '/usr/lib/GNUemacs/etc' and '/usr/lib/GNUemacs/info'.
The variable EMACSLIB overwrites the default value for the lisp-library-dir, EMACSDOC is the same for the documentation.
To support 'add-log.el', you can set some variables to identify your machine and yourself:
USER or LOGNAME is your user-name (as on unix)
FULLNAME it's you full name (of course :-)
SYSNAME is the name of your machine (default: st-tos)
Environment variables are expected in unix-format. In gulam you get this with 'set env_style=mw', in master 'setenv UNIX [n]' with [n] > 0.

4. Special Files

At startup time emacs loads $EMACSLOADPATH/loadup.el and this loads $EMACSLOADPATH/site-ini.el, then ~/emacs.rc or $EMACSLOADPATH/default are loaded. To inhibit the last step, you can use 'emacs -q'.

5. Functions ommited in this Version

All functions dealing with the user-id, dumping of emacs (which would at least be very difficult in TOS) and asynchronous processes.

6. New Functions

Not new but a different implementation has call-process. This is essentially a system()-call (via _shell_p) to the running shell. The output (and input) for shell-commands is redirected in (and from) files if the variable shell-tmpfile is non-nil. If this is nil a feature of my favourite shell Master is used, namely redirection of the output in the shell-variable SHELL_OUTPUT via '==>'. In addition the new function getvar is used to get the value of such a shell variable into the emacs environment. The function time-to-string converts a time pair as given by file-attributes into a human readable string. If you suspend emacs (either by pressing ^Z or using 'suspend-emacs') the running shell is invoked with '-i' as single parameter (gulam is called with 'ue', the craft-shell with 'sh'). You can go back to emacs with the 'exit'-command of your shell (gulam: ^Z or ^X^C).
ST-specific functions start with 'st-'. You can switch on mouse-support with

'st-enable-mouse' (switch off with 'st-disable-mouse'). See also "st-mouse.el".
The file "shell.el" has implemented a shell-mode as a first try. In master you should set 'varsize 50000' (or another large value) to get all output.
Sometimes if the shell sends escape-sequences you may need to redisplay the screen with ^L. In gulam you should set 'st-shell-tmpfile' to a filename on a RAM-disk to speed up execution. The command 'call-process-on-region' seems not to work under gulam (it always wants to read from the console).

7. Keyboard

The Alternate-key is used as emacs' Meta-key. The function keys, the keys on the cursor block and those on the numeric keypad have ESC-sequences assigned which start with ESC-# and then follows either the ascii or the scan code returned by the key. The escape sequences are different when you press Alternate at the same time. The file 'atari.el' contains some sample key bindings for those keys.
Alternate is only accepted if meta-flag is t or your termcap-entry has the xm capability set. Instead of Esc-# the function keys start then with M-# ('#'|0x80). This is invaluable in incremental-search.

8. Memory requirements

Emacs was designed for computers with (nearly) unlimited virtual memory. Since the program crashes very fast if you have no more memory, you should obey the 95% warning. The actual version uses the whole system-memory from the end of BSS until it's own memory top for malloc and the stack (alloca). The warning is only given by malloc. You can ask about your free memory with 'M-Esc data-bytes-free'. At file-offset 366828 is the variable system-heap (default 00 01 90 00 = 100 kB), which tells the program how much space it should leave for the operating system (and so the shell). On a Mega ST4 you can enlarge this value. With 1 MB main memory, you can set this to a few kB. You can do this with a disk monitor (hint: the above sequence of 4 hex bytes appears 2 times in the whole file temacs).

9. Creating a dumped Version

You need two different memory dumps to get a new (relocatable) emacs. The dump files will be ~500 kB large. The running emacs is 520 kB (380 kB packed).
Please see the file dumping.txt for instructions how to dump temacs and produce xemacs (= emacs). And please: ask me if you have any problems (E-Mail address is below)! This was the most tricky part for me too!

10. Misc

Emacs recognizes extended argument passing with the xArg protocoll of Dale Schumacher. The modified system vectors (address error, VBL queue and etv_term) are marked with "XBRA" & "GNUC". Because the routines for the keyboard interrupt are very time critical, emacs shares the routine with other programs (if they are started before emacs and the version number is the same). Emacs has been crosscompiled for Atari ST on a Sun 3/60 with the GNU-C compiler version 1.35 and also compiled on a Mega ST2.

A friend of mine would like to sell the following system:

CPU: Atari Mega II ST (2M RAM)
Monitor: Atari SC1224 Color
Hard Drive: Atari Megafile 30
Software: Much PD stuff and the standard included packages
Purchase Date: September 1989
Condition: Everything in excellent condition
Price: $1800 negotiable

For any inquiries please contact the seller, not me. He is
Bill Barnes at (215) 679-7524 (Allentown, PA area).

>
> Any info on any of the above questions would be greatly appreciated.

Andrew, I had the very same problem with my mouse. If you have a
soldering iron it is easy to fix. Just open up the mouse and find the
little infra-red transmitters and receivers on opposite sides of the wheel.
The problem with mine was that one of the receivers wasn't quite lined up
correctly with the transmitter (must'v gotten jarred) so I melted the solder
and just 'reseated' it on the board. Works fine now. Good luck!

200. Re: media change problem with Toshiba drive - SOLVED!

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 22:20:11 UTC

Message-ID: <7294@shlump.nac.dec.com>
Source record: 245044

In article <1990Jan5.103650.28987@gdt.bath.ac.uk>, exspes@gdr.bath.ac.uk (P E Smee) writes...
"
"Chinon drive mechs (some models) had this problem. The cure for the
"affected Chinon mechs (which I'll describe in case it helps find a fix)
"is to open the disk drive and have a look around. (KEEP YOUR GREASY
"FINGERS AWAY FROM THE DISK HEADS AND ACTUATOR.) The mechs had two
"adjacent and identical push switches. One was the write protect
"switch, pressed down when you insert a disk with the protect window
"closed. Next to it was the 'disk present' switch, pressed down when a
"disk is inserted. (You can see which is which by putting a disk in
"while you've got the mech opened up.) The cure was to put a jumper
"across the pins of the 'disk present' switch, so that the drive always
"thinks there is a disk in. Those mechs only report 'write protect' if
"there is a disk in -- if they always think there is a disk in, then
"'write protect' does the right thing when there isn't one. (Sounds to
"me like, for your mech, you'd need both to nobble the media-change
"diode, and the 'disk present' switch.)
"

This worked fine on the Toshiba drive. The difference was that
I had to cut an etch going to the switch to keep it open instead
of jumpering it. (Think that affects my warranty? :-)) The
diode is not needed with this fix.

Jumpering or adding a diode between pins 2 and 28 doesn't work
with this drive 'cause of the way the disk change signal works.
It goes active when a disk is removed but isn't reset until the
heads are moved. (gated with drive select of course) So - if you
try to write to a disk that was just reinserted, the ST reads
the directory from track 0 but does not move the heads. Since
disk change is still active, if 2 and 28 are jumpered, the disk
will appear to be write protected.

I had a two gate fix figured out but the change suggested above
is much more elegant.

201. reset botton problems

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 22:34:47 UTC
From: piner@pur-phy
Message-ID: <2979@pur-phy>
Source record: 245045

Howdy folks. I have a small problem and I was wondering if anyone knows of a fix. I got a used 1040st for my nephews this christmas. The machine runs fine. But, it locks up when the reset button is pushed. The screen goes blank, the disk drive does not come on, and the power supply makes a high pitched hum. Cycling power gets the machine restarted. In normal use, this situation would almost never come up. But, my nephews would like to switch back and forth between OS9 and TOS. Does anyone know what the problem might be. Anyone fixed it?

While I'm here, I have a helpful hardware hint of my own. When I was looking in the machine, I noticed that the screws holding down the power supply were loose. They were striped out. Who ever had been there before me had turned them a bit too hard. The ST sure wasn't made to be worked on. Anyway, I got a 5-40 tap and tapped the holes down to the bottom. A couple of 5-40 screws about a half inch long worked well. Now a least the power supply is secure.

202. Aegis Animator

Newsgroup: comp.sys.atari.st
Date: 1990-01-08 23:50:46 UTC
From: aimd@castle.ed.ac.uk
Message-ID: <1513@castle.ed.ac.uk>
Source record: 245046

The author of a commercial animation package, Aegis Animator recently obtained the rights to his program and re-distributed it in the public domain ('cos he figured he would make just as much money!). The public domain version is called Ani-ST. It'd be a nice thing to have, it used to cost 80 quid (erk!).

Has anyone got it? And if they do how about sending me a copy or putting it on terminator or some other archive, pleeeease...

Btw, I've been looking around the archives for a few months but have never seen Toy Prolog. Toy Prolog is a much better implementation of DEC-10 Prolog than Xprolog (at least better than the version of Xprolog I've got). I've used TOY with much success (it's even got DCGs). It's kinda slow but it's worth a look - any takers?

Happy New Year!

Mark Davidson.

Hi

Is anyone familiar with GFA Draft Plus? It seems to have a
problem showing levels. The current (working) level displays fine
but the background levels are plotted on the upper right hand side
of the page (not the window) and are scaled down about 8 times.
The same feature on the older GFA Draft worked fine. Any ideas?
Thanks in advance

> I am not too familiar with the innards
> of my machine, and after talking with some dealers I am even more confused.

I don't blame you; they don't understand them, and they have
an unbelievable ability to pass on their confusion to others.

> 1) Can the ease of upgrading the memory be dependent on which version of
> TOS I am running, or are these entirely separate issues?

They are totally separate issues.

However, TOS V1.4 is more _convenient_ to use with large memory
machines, because it does not insist on clearing all free memory
at image activation time. There are patches that alter this
behavior on older versions of TOS.

> 2) One dealer says it will take three weeks, another says it takes an
> hour (and his cost is better too.) However, after 6 weeks the chips
> are not in yet. Other dealers confirm that the chips are hard to
> get. There is no dealer in the S.F. Bay Area that can do the work
> *now*, mainly because the chips are not available. Is this normal?

Ah, so you want the _dealer_ to do it for you. Not an unreasonable
attitude.

"The chips are hard to get"? You _must_ be joking. I live in the
SF Bay Area, and I just upgraded my machine (1040STf) to 2.5
megabytes. I bought a Z-RAM 3D from San Jose Computer, and
1 megabit low-power CMOS DRAMs from Fry's Electronics in
Sunnyvale. Both were easy to get (one afternoon) and install
(took me about a day).

> 3) One dealer said that in January there will be a board that will
> accept plug-in memory chips. Is this really true? Will it really
> be in January (1990)?

Come now. See above.

> 4) Where can I get the chips, assuming I will have to get them myself,
> and dealers don't have them?

Fry's advertised price, 1 Mb/80 nS DRAMs: $8.99 each.

> 5) What sorts of things can go wrong during this procedure, and how can
> I test it afterwards? (I assume by reading & writing to the highest
> memory location???) I am conversant in assembler if the answer to
> this requires such.

Well, unfortunately many things can go wrong.

The expansion board I used came with two diagnostic programs: one
a simple tester, and the other is an exerciser.

It also came with a LOT of troubleshooting information, including
scope, multimeter and logic probe tests.

Oh, I forgot to mention: the documentation says the company will
do the whole schmear for you for $30, and return your ST to you
in 72 hours. And they're in southern California, not too far away.

From: sbrown@bgsuvax.UUCP
Message-ID: <5308@bgsuvax.UUCP>
Source record: 244904

I've been working with the Dosound command using 68000 and have been running into a little problem. Is there any way to get the sound to continue without automatically shutting off? The only solution that I can find is to set up an interrupt to take care of the sound. I believe that I accessed the Yamaha chip directly when I was experimenting with Supervisor mode and still got the same results. I liked my old Atari when the sound didn't change until I tould it to. Thanks in advance.

In the interests of heading off some useless notes, I need to point out that a future issue of ST-World has an article on the USENET->GEnie link. This article was written FAR in advance of the flamewar here, way before it was closed down (it is STILL down, okay?). Articles have to be written far in advance because of the necessities of printing and distribution.

Most of the readers, I think, that have seen this stuff will understand that it's dated material; I wanted to make it clear to the rest that the material *NO LONGER APPLIES*. Please, no "rape of usenet" style flames!

It may be of interest to note that GEnie has told me they are quite interested in a 2-way link (a 1-way isn't wanted), good 2-way email, and a complete lack of copyright hassles. GEnie has a compilation copyright, but as they put it, what's the point of it when USENET is doing the compiling, and not only on their system, but thousands of others, in nearly the exact same format?

Putting it mildly, the depiction of GEnie as profit-mongers interested in mass-rape-of-USENET-notes is false. I hope to post an official reply from GEnie to this phantom stuff shortly which will confirm what I'm telling you -- basically, they want to do what WELL and PORTAL do, just offer another service to their subscribers. And anyone who can read an ad knows they're not gouging; as for me, I pay WELL happily, and get irritated when someone tells me I shouldn't even have the option to pay such money.

I realize I sound defensive, but you've got to realize I spent pre-Christmas having accusations with nearly no ground in fact flung at me, being threatened, and so forth.

Anyway. In summary, the ST-WORLD article is OLD NEWS, was written BEFORE any of the flames here, and DOES NOT REFLECT WHAT'S GOING ON NOW. (It's largely future tense anyway, and partly a technical description.)

212. C, loading fonts problem part II

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 07:12:00 UTC
From: V067MAJP@UBVMSC.CC.BUFFALO.EDU
Message-ID: <F7F1A7E366DF601455@UBVMS.BITNET>
Source record: 244906

sorry, I didn't mean to include the entire source and in a post by itself, that was an accident. Well, anyway the problem is that for some odd reason after the call to vst_font, addfonts and c both become zero and I have no idea why. Also, after it displays the system font, it bombs out with 2 bombs, but if I run it again, it will increment c from where it bombed out (e.g. if it bombed out with c=2, if I run it again right after, it will increment and c=3). I'm using Sozoban C 1.2 Dlibs 1.2 GemFast 1.3 G+Plus 1.3 a unmodified (unfortunately, I could use more memory) 520STfm. Is my problem with C, VDI, GDOS or what?
This code is modified from the Compute book on VDI (it didn't work as written either)

From: t68@nikhefh.nikhef.nl
Message-ID: <715@nikhefh.nikhef.nl>
Source record: 244907

In a previous article A. Pratt comments about that the terminate
vector should only be used to terminate. There are exceptions to
this!!!!!!!!
A good editor that runs from a good shell (a shell which has installed
an emergency break, so that a child process can be stopped) should
not be killable. See for instance vi under UNIX. Ctrl-C won't kill
it.
The problem is that Atari has no proper way to kill a child process,
so kludge methods has to be made to make GEMDOS believe that the
child itself asks for termination. After that there are some
children that don't want to be killed. This can be done rather
easily. Make a routine and install it as termvector. The whole
routine reads:
unlk a6
rts
This causes a return from the term routine in GEMDOS before
it starts cleaning up (I can hear Allan already.....).
Of course it would be much better if Atari would come up with
some standards on how to do this in a conventional way, together
with a proper way to kill processes that don't produce output
via GEMDOS. Using the environment seems to clumsy because it
has to be checked before the kill command (Pterm) is given,
which means that the environment has to be checked from an interrupt
routine. That isn't nice.
A reserved variable in the low memory globals would be better.
It the variable is zero, the process may be killed.
A second variable/flag could indicate whether the Atari is going
to kill a process safely (for instance only when the PC points to
an address inside the memory of the process).
Sounds like some work for Allan to make up a good scheme.

Happy New Year, 16 Bit Chums!

Three things today - please reply to me by email if possible since my receipt of info-atari16 is gappy and prone to weeks of delay...

1) I have a new SM124 which seems to me to be slightly fuzzy, or at any rate fuzzier than the one in my office. Before I start asking the dealer about this, as this is already a replacement for the faulty one first supplied, I thought I'd ask "Is there any way of adjusting the beam focus inside the unit?"

2) Does anyone have any recommendations for a Music Printing package for the ST? Specifications are a) qwerty input (not piano keyboard)
b) output to HPLJ+ or HPGL or PostScript file
c) Must look very good!!!
d) Initially needed for Piano music so at least two staves, plus text inclusion.
I don't want any fancy synthesiser driver or Midi wunderkind, just nicely printed music. Any ideas, folks?

3) I asked a while back about spreadsheets...here is the summary..

BUY LDW POWER.

Well, that's all folks. Hope to hear from you.

Jan Ameij,
Department of Applied Metaphysics,
Oxford University.

From: jackin@vehka.uta.fi
Message-ID: <791@kielo.uta.fi>
Source record: 244911

There has been a lot of talk about SLM 804 and other laserprinters. SLM wins due to DMA-to-SLM - connection (in speed). Is it possible to make other lasers faster by making a DMA-to-'whatever fast slot there is' - connection. Atari's centronics is supposed to stop at 19.2 Kb, but how fast can Laserjet's centronics do ? There are other slots in lasers too, don't know if they are any use. Maybe somebody with more technical knowledge could tell if it is possible.

By the way, I read in 1/90 ST Magazin that a group of developers from Stuttgart are making a Appletalk-emulator (due out 1st Quarter -90). As a bonus it should include full Mac-sound (sound comes through your own hifi-equipment). You may try to get more information at

Fearn & Music
R{merstrasse 21
7000 Stuttgart 1
W. Germany

(at least they advertise : 'Demn{chst: AppleTalk hardware Emulation').

MM.

PS. Thanks to all who responded to my questions concerning GCC, I finally got it. I couldn't get my thanks through (our sun has been a bit hazy last couple of months)

>So why spend money on [PC] emulators, anyway?

Good point. I bought a 9.7 Mhz NEC Multispeed for just $640 US recently, which not only is a perfect emulator, it permits true multitasking (I run it at the same time as the ST). However, when my PCditto upgrade board arrives I plan to install it in an ST with a colour monitor, since colour is expensive even on the PC.

For what PCditto costs ($200 for the upgrade) it is probably worth it, but I agree that there is probably not much value at today's prices in buying a PC emulator from scratch.

221. opus 2.2

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 16:16:03 UTC
From: SCHMIDTM@CMR001.BITNET
Message-ID: <900109.11315763.061000@CMR.CP6>
Source record: 244915

I've been trying to make opus 2.2 function properly, but ran
into several snags. Has anyone been able to make a proper
complete installation?

Here are the problems I ran into:

-I'm on a 1040st, single drive, and have both GDOS and G+PLUS.

To begin the installation, I re-installed GDOS for the
Epson FX-80.

Now, the first problem was that ASSIGNER.PRG refused to accept
the newly-created ASSIGN.SYS file as valid; it said that it was
a bad file or had more than 2000 lines in it. This same ASSIGN.SYS
file worked well with both GDOS and G+PLUS.

I decided to let it go, because the OPUS install docs said that
this was only to make sure that we had a 1:1 correspondence
between screen and printer fonts, and I had that (I think).

After that I tried running FONTWID.PRG. It took a while to
discover that I always had to have the GDOS disk as A:, and
the OPUS disk as B:, but after a while it ran ok.

Now, when I loaded OPUS, I got the same error as several other
people reported earlier, i.e. OPUS says that the screen fonts
don't match the printer fonts, and won't enable charting! Ugh.

Anybody out there got any ideas? HELP!!

222. Re: Physbase vs Logbase

>Can anyone tell me what's the difference between Physbase() and
>Logbase()? When can I expect them to be the same/different?
>
>Thanks in advance...

jrd,
These are the same under normal operation, but they _mean_ the following:

char *Physbase() returns the actual location of the screen in memory, where the
display hardware goes looking for screen data when it wants to draw the screen.
Note that you can set the Physbase with certain alignment restrictions on
the ST, but in the STE and TT these restrictions (page boundries I believe)
have been lifted.

char *Logbase() returns what the VDI thinks is the screen location in
memory, which, under normal operation, will be exactly the same as Physbase.
It's useful to change Physbase so that you can build your screen on the
side (without the user seeing the drawing in action), and then flip the
screens to show the user a completely new screen.

So, for page flipping for animation, you'd be using
Setscreen(log,phy,res) with res set to -1 to indicate no change, and
log and phy set appropriately to draw to one virtual screen, and look
at another, and look at a new one and draw to the old...

Hope this helps!

>You're dead wrong on this one. The Mac II series does provide for 16.7
>million colors. Whether you get it or not depends on the video display
>board installed on the Nubus. In front of me is an ad from Radius for
>their DirectColor/24 which can simultaneously access every one of the Mac's
>16.7 million colors. They also make a 16-bit board (32,768 colors simul-
>taneously) and 8-bit board.

Now let's see, what sort of video display unit do we need? 16 million colors displayed simultaneously would imply 16 million pixels, or a resolution of 16000 x 1000 pixels, or 8000 x 2000 pixels, or 4000 x 4000 pixels.

Considering that such video display units do not appear to exist in the real world today (if you _do_ know of one, by all means give the address of the vendor -- and the price!), I highly doubt that there is a display which can show all 16 million colors "simultaneously".

As an aside, consider that each pixel requires 24 bits (or 3 bytes). The DISPLAY MEMORY alone would be 48 megabytes in order to display 16 million colors "simultaneously".

What can we therefore conclude? Although 24-bit Color is possible on a Macintosh, using non-Apple hardware, there are no Macintosh computers which can currently display 16 million colors on screen simultaneously. The standard operating system limit is 256 (ie. buy Apple monitor and RAM card). In order to be able to display 16 million colors on screen at the same time would require investment in 48 megabytes of memory (at $100 / meg this is about $5000), AND use of a video display with a minimal resolution of 4096 x 4096 pixels. I expect that the display would cost more than the memory (by a long shot).

-- David Paschall-Zimbel

On second thought, the display device probably does exist -- given all of the wondrous CAD/CAM systems which one can purchase ... but then why bother with a Macintosh when the 'real thing' probably doesn't cost much more?

225. Quantum fixed

Cross-posted to: comp.sys.atari.st,comp.sys.mac

For those interested in the solution to my
intermittent powering down of my Quantum 80S:

THe lubricant surrounding the actuator arm
is rendered ineffective due to various
circumstances including certain conditions of
humidity and dust. The fix is a chip produced
by Quantum that can be installed by your dealer
that forces a random seek across the platters
during periods of inactivity. Apparently the
Seagates already do this.. and the "new" Quantums
come with the chip fix.

So far, i have had my drive running flawlessly for 14 hours..
seems to have done the trick.

THought i'd mention the GREAT service given by MacLand in Tempe, AZ.
They recieved my drive on Thursday morning, made the chip insertion
and ran a test.. had it mailed out THAT DAY Fed express 1-2 day delivery.
Can't ask for better service! ALso, Jay Denton, one of the techs, was
very concerned and helpful.

Apparently, the problem I had is rather common... so if
your Quantum starts failing to read/write due to a spin problem..
you may investigate the possibility of getting the rom chip (v. A200)
from your dealer.

Source record: 244920

My 4 meg upgrade board (FrankenSTein) for my 1040ST just arrived and another user upgraded his Mega 2 to a Mega 4. Both of us are GCR users (hey Dave, do I send back my Gamma test board or just keep it as a momento?). I read on the net that multifinder is now stable in an as yet unreleased version of the GCR software. When will the GCR stable version be released? With 4 megs, it would be great to use MF under GCR.

As yet, I have not seen any feedback on the net re: codes I could not get to run on an STE. Is the mailer slow or doesn't anyone have info? Hey Atari, anyone have a demo code to show of the STE's graphics and sound? How about a decent manual for the STE instead of an addendum sheet? Does anyone at Atari know why a save desktop in medium resolution still results in a boot to low res on an STE?

Finally, I have STs running with OMNIMON multisyncs - they're great!

227. CAD 3D

I finally got around to playing Elite! Great game. I have been playing for a week and I have finally gotten all the fun toys for my ship. I have a few question Elite status pilots might be able to answer.

Can you play the game without becoming an 'Offender'. I blew up a pirate and picked up his cargo and it was guns. I couldn't get rid of the stuff so I had to sell it. I don't see how you would get anywhere if you didnt hunt pirates on the side so are you reqired to be semi-illegal?

If your status is not clean you occasionally get cops chasing you. You can't outrun them (unless you hyperspace out) but if you kill one you become a fugitive and then they chase you around forever. Wouldn't be so bad if they didn't try to kill you; you are forced to kill them.
Am I missing something?

The docs say there is room for two people in the ship. Does this come to play in the game?

What do the colors in the 3d section mean? Are they explained anywhere? I have figured them out (for the most part) but I can't find them explained in the docs.

Since the US needs to be seriously educated about Atari, especially because they already have a negative image (so you aren't starting from zero, you have to get yourself out of the whole FIRST before you can do any positive stuff), it would take a mighty big splash, costing a mighty large amount of $$$, of which Atari probably can not afford to spend.

You can't get the greater returns if you can't put up the capital.

Well, the title interested me....

Unfortunately, the message was not about QUANTUM PAINT...

Anyway, my quantum paint is a pile of decomposing software and paper.

The software is practically useless since, for me, quantum paint always
recalculated the pallete for colors for the scan lines of the frame...
and in doing so it CHANGES the ACTUAL COLOR of what I have drawn!

For instance, I draw 30 lines from the top of the screen to the bottom.
Either during this time or shortly after, the system will recaculate the
colors and change them (the new colors arent even close).

Anyway, the only format that was interesting was the 4096 color mode...
but as of yet I have not seen ANY programs that convert from this
mode to ANY OTHER mode... like GIF.

Anyway, has anyone ever seen a fix/program for either of those
two above mentioned problems? If those two problems were fixed,
quantum paint would be a decent product worth the money.

>(i.e., it calls the xbios hook in dstart.o, provided with Sozobon).
>
>Saving the stack pointer before the trap and restoring it afterwards
>fixes things.

I don't believe it's a question of the stack pointer. When you return
from the BIOS your sp is ALWAYS what it was before you went in.
(How else could anything work?)

I think it's a reentrancy problem. The OS hooks seem to use external
storage, meaning they're non-reentrant. Worse, they all use the SAME
external location, so in a given program, you can't call BIOS from
BIOS, but you also can't call XBIOS from BIOS!

(Study the flow of a BIOS call which calls XBIOS when both go through
the same hook: the mainline calls BIOS, saving the return PC someplace.
That BIOS code calls XBIOS, saving it's return PC IN THE SAME PLACE!)

On the other hand, it shouldn't matter, since the Pterm call in question
never returns.

Hooks like this can be made reentrant by changing how they work:
instead of this:

move.l (sp)+,trapret ; save return PC
trap #$x
move.l trapret,-(sp) ; restore return PC
rts

you could use this:

movem.l 4(sp),d0-d2/a0-a2 ; get 6 longs' worth of args
movem.l d0-d2/a0-a2,-(sp) ; push them
trap #$x
add.w #24,sp
rts

This uses no external storage (and therefore is reentrant). The point
is to give the trap the intended args without the hook's own return PC
in the way. The first method pops the PC off and saves it, while the
```

second method does it by copying the args into a new stack frame.

A friend and I each ordered Lynx's through the Sears catalog, and we both got them. About LA and New York distributing--the final word was that they were only to distribute in New York. A friend saw the commercials there, and he tells me they were quite impressive.

Kitty World in San Jose also stocks the Lynx, though I hear they have sold out several shipments of 50 Lynx's...

It wasn't quite Atari's fault that there weren't several million Lynx's shipped--the manufacturer of the LCD color screen was the bottleneck in production; I believe they made as many Lynx's as they could buy screens.

In any case, the Lynx side by side with the Gameboy so outshines it that I think it will do well, regardless of the poor timing...

I hope, anyway... The Lynx is a wonder of blitter and processor technology that outshines ANY other home video game...it deserves to live. (I can't expand much on that--non-disclosures prevent me--suffice it to say I was at the Lynx developer's conference way back when and I know how it ticks...and it certainly ticks QUITE well...)

Yes I have a multiline system from Nite Lite Systems ,Billerica, Ma.
Its main purpose is for Multiline BBS systems but it can be easily
used as a Lans system for inter-office communications even at variable
baud rates 9600,2400,maybe higher Bps. Anyways for more info call
617 663-2885. If you are local to K-W area I have one for you to try
out. Its quite interesting and comes with source code in Pascal. Also
works for an IBM system etc. I havnt used it for a while it has alot
of features and can be reprogrammed.

238. Dead Mega2

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 20:47:13 UTC
From: rick@jhunix.HCF.JHU.EDU
Message-ID: <3906@jhunix.HCF.JHU.EDU>
Source record: 244932

OK, I've got a dead Mega 2 ST. Probably the power supply. For about 20 seconds it sounded like there was a piece of paper caught in the fan, then the thing completely blacked out, no power light or anything.

Thus far, my alternatives to getting it repaired seem to be either having one local repair center cannabilize a 1040 power supply at a cost (parts and labor) of around $200, or having the thing sent back for $60 and six or so weeks, none of which seem attractive to me.

Is there anyone who has had this problem, and can suggest a way a couple of undergraduate EE majors can fix it?

Is there any reason that the power supply in a computer that is of course out of warrantee but less than six months old and plugged into a fairly decent power line filter and surge protector should die? My old 520's have never needed repair, but if that's the way Atari builds their new computers, maybe the popular opinion of computers isn't so off-base (yes, this is somewhat of a flame. I've got too much invested in the damn thing to have to deal with hardware beneath even Apple's standards).

Eric

> fugitive and then they chase you around forever. Wouldn't be so bad if
> they didn't try to kill you; you are forced to kill them.
> Am I missing something?

There are a couple of ways to avoid this. The obvious one is to never
pick up cargo from a pirate -- you have no way of knowing what he was
carrying; it may well be contraband goods. You can still use them for
target practice without affecting your status. By the same token, you
should never try to pick up escaped life pods from pirate ships; they
come in as slaves. Thargoids are OK, though; they're alien items.

If somehow you lose your clean status, you can escape from your ship if
you have purchased a life pod. The status stays with your ship, and you
end up docked with a ship furnished exactly the same as the one you
ditched (thanks to the "insurance policy" provided by the life pod
purchase), minus the life pod.

Or, you could just restore the game from a point at which you were clean.

> The docs say there is room for two people in the ship. Does this come to
> play in the game?

At various points in the game, after several hours of play, you'll be
offered the opportunity to go on missions. The extra passenger room
comes into play on one of these.

> What do the colors in the 3d section mean? Are they explained anywhere?
> I have figured them out (for the most part) but I can't find them explained
> in the docs.

Let's see... A flashing object of any color is an enemy and will fire
on you. Purple objects are cargo cannisters and asteriods. Yellow
objects are non-hostile ships of various kinds. Gray objects are

pirates, thargoids, and thargons. There seem to be two shades of gray, but I haven't yet related them to any differences in the ships. Those are all I've seen.

I'm currently stuck on mission 5 (which I won't detail to avoid spoilers). If anyone knows how to complete it, I'd like to hear from you!

>
> Keith Groves

I have been able to boot off of the floppy drive using cntl-shift-alt
combination with Supra's autoboot program V2.62 and TOS 1.4. You have
to wait until the floppy drive light flashes before you press the key
combination. All goes well after that.

I do have another problem. I just installed DC Showit in my Auto folder,
and now I can't change to low resolution from the desktop. Is this a
feature of DC Showit or an incompatibility between it and TOS 1.4?

Thanx in advance

243. PageStream 1.8 Bug (?)

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 23:09:57 UTC
From: steveg@SAIC.COM
Message-ID: <9001092309.AA02621@CASPIAN.SAIC.COM>
Source record: 244937

Well so far I've encountered several problems with the 'debugged' version of PageStream (1.8). Some are bugs, others are annoyances. The first was relayed previously and has to with outline text appearing see thru when placed on top of other objects. Fill styles only fill the area AROUND the text not the letters themselves. In trying to create a deep shadow effect, you can overlay several copies of your text offset about 0.01" over and down (up and over etc), from each other, then place an outline copy on top. The resultant output on my SLM804 is quite pleasing, but the screen display is a mess.

The 'UNDO' feature still does not work in all cases. As a bare minimum, you should be warned before the program executes something that cannot be 'undone'.

Inconsistent defaults on entering font/size selection form. Sometimes it defaults to the font of your selected block, others to the first font available.

Real annoying habit of ALWAYS asking whether a font/size change should be global or block only - why not a little checkbox in the font/size dialog that you can toggle as needed?

The screen is still not properly redrawn after moving some objects - object 'handles' get left on the screen, objects can be rotated/stretched so they seem to disappear etc.

Finally, I've recently had a problem printing Postscript to disk. If I create a file from scratch all works fine. However, upon re-entering the program and opening the saved document, an attempt to print to disk triggers repeated screen dumps to the laser! I've got a number of AUTO folder pgms and ACCs loaded, and a lot of fonts, and haven't tried to duplicate this yet with a 'clean' system, but it's still quite strange. If the screen dump AUTO program is not loaded, the system just hangs. Anyone out there have similar problems to what I've described? Any guesses as to when the *real* debugged version will be out? :^)

Sure glad I didn't jump in until v1.52 was out. I shudder to think what 1.0 was like. Don't take me wrong, once you know how to navigate around the traps its a very useful and powerful package, but it drives me crazy whenever I run into software whose annoyance factor is just barely outweighed by its utility factor. That is to say, all things considered, it's an OK program, but with the potential to be a *great* program.

244. TIFF translator

Newsgroup: comp.sys.atari.st

247. Re: too late for Lynx ...

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 23:34:55 UTC
From: drp9500@ultb.isc.rit.edu
Message-ID: <1888@ultb.isc.rit.edu>
Source record: 244941

Atari's problem with the Lynx stemfrom Epyx going bottom up....

it kind of left Atari high and dry so only the part of Epyx that does the acutal manufacturing is still around. Still this delay it what caused the Lynx to miss christmas nationwide.

As for availability, at home I get stations out on NYC on cable and have seen numerous adverts for the Lynx. It IS there! Almost all of the larger toy stores in NYC have them. 70,000 units were shipped to LA and NYC and Atari expects to ship in excess of 1,000,000 units in 1990.

248. Double open file warning

Newsgroup: comp.sys.atari.st
Date: 1990-01-09 23:57:17 UTC
From: apratt@atari.UUCP
Message-ID: <1939@atari.UUCP>
Source record: 244942

Talking with Dale Schumacher led to the following concise warning:

If the same file is open more than once, it's trouble.

That is, if you Fopen a file, then Fopen it again without calling
Fclose on the first handle first, you are courting disaster. When
either handle is Fclosed, using the other one might or might not lead
to any sensible results.

This ESPECIALLY applies to having the same file open by two different
processes: if you Fopen a file, then Pexec a child, and that child
Fopens the same file, you're in deep doo-doo. When the child Fcloses
the file, or Pterms (which closes all its files), the handle in the
parent might or might not refer to anything sensible.

Fdup and Fforce suffer from the same problems. It's all in the data
structures which turn handles into files and eventually into blocks on
disk. They're done wrong. This is true for all existing TOSes:
1.0, 1.2, 1.4, and 1.6.

249. lharc/arc/zoo/compress

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 00:31:45 UTC
From: chen@digital.sps.MOT.COM
Message-ID: <47f0d326.81da@digital.sps.mot.com>
Source record: 244943

I did a quick and dirty comparision on four compression programs in an UNIX box.And here is the result:

Program Size Cmp Size Ratio Comp. Time Decmp. Time Comp. Speed Decomp. Speed
byte byte % second second byte/second byte/second

(Text)

lharc 961244 253799 73.6 353.8 63.8 2717 15067
compress 961244 302096 68.6 29.4 22.6 32695 42533
zoo 961244 368158 61.7 85.9 48.2 11190 19943
arc 961244 425193 55.8 163.4 111.0 5883 8660

(Binary)

lharc 293489 130670 55.5 101.7 32.3 2886 9086
compress 293489 167001 43.1 13.5 9.2 21740 31901
zoo 293489 170255 42.0 33.8 17.2 8683 17063
arc 293489 180114 38.6 55.7 37.8 5269 7764

Text file: xlib document (nroff output)
Binary file: mush (apollo m68k coff)

Program versions:

compress 5.1
lharc V0.03 (Beta)
arc 5.21
zoo 2.01

Observations:

o In terms of compresion size, lharc ranks on top, with 5-12% better than compress, 12-13% better than zoo, and 17-18% better than arc(5.21).

o In terms of speed in compression mode, compress rates much higher than the rest, in the order of 2.5-3 times faster than zoo, 4-6 times faster than arc (5.21), and 8-12 times faster than lharc.

o In decompression mode, the speed differences are less than the ones in compression mode. Compress still rates the fastest, with 2 times faster than zoo, 2.5-3 times faster than lharc (not bad), and 4-5 times faster than arc (5.21).

There's no doubt people who use online services love `lharc', in which transfer time is their main concern, giving the fact that `lharc' provides over 10% better compression ratio than other methods. While other situation when storage space and process time are to be balanced, `compress' probably is

the choice.

I read from the README file in arc 6.0 (ST version) that 6.0's speed is quite fast comparing to 5.21. However, the compression ratio changes very little. I doubt even arc 6.0 can beat other three programs in both speed and compression.

Of course there are other issues involved when comparing these programs, such as feature of including comments, capability of including multiple files and/or directories. For now I just simply ignore them.

In case anyone interested, the tests were run on an Apollo workstation DN3000 (12 Mhz 68020/68881) with 8M memory (OS SR10.2), which is approximately a 1.9 mips machine (comparing to the 0.8-0.9 mips 8Mhz 68000 ST). Run times are reported in user's time.

250. EMULATORS

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 01:06:18 UTC
From: FRAJKOR@CARLETON.CA
Message-ID: <900109.20085072.014763@CU.CP6>
Source record: 244944

I am puzzled by those who suggest that there is no point to buying Mac / PC/ etc emulators because you can buy Messy-Dos machines sio cheaply today.

Personally, I would rather have a wife who is (a) sexy (b) intelligent and (c) a hard worker than three who are one of each. Even if you can get the other two cheaply.
Personal taste, of course.

251. Printer problems

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 01:08:58 UTC
From: FRAJKOR@CARLETON.CA
Message-ID: <900109.20154976.014763@CU.CP6>
Source record: 244945

Ok, if someone can think of an answer to this one I will
be forever grateful, if not generous.
One day, my 1040ST started printing nothing but garbage
when hooked up to EITHER of my two printers, Canon PW1156
and HP DEskjet. Through EITHER of two buffers.
Both printers, through either buffer, work with a
Commodore 128 and an IBM-type portable. So no problems with
printers, cables, buffers. Must be in tthe computer.
I took it to the dealers. It printed fine. Must be the
software. I brought down my software. It printed fine. I brought
down EVERYTHING. It printed fine. I brought home everything. It
prints garbage. I am at my wits end and do not feel like lugging
my system to the dealers everytime I want to write to my mummy.
Is it possible that the level of AC current in my home is
at fault, and one bit in one chip somewhere is so weak it does not
flip? Is it possible that electrical interference somewhere in
my home can do this? I can't figure out why it began to do this
all of a sudden when I have changed nothing.
There is nothing in my manuals about how to deal with demonic
possession.

253. GFA Draft Plus

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 02:31:00 UTC
From: STJLHI33@wooster.BITNET
Message-ID: <9001100811.AA18495@ucbvax.Berkeley.EDU>
Source record: 244947

Hi

Is anyone familiar with GFA Draft Plus? It seems to have a
problem showing levels. The current (working) level displays fine
but the background levels are plotted on the upper right hand side
of the page (not the window) and are scaled down about 8 times.
The same feature on the older GFA Draft worked fine. Any ideas?
Thanks in advance

Subject: PC-Emulators

There was recently a query concerning hardware PC emulators on the net, I would like to help out a little by offering a reply.

First it was pointed out (and rightly so) that you could pick up a cheap PC for $400, however this in itself is a very inefficient solution as:

i) Who wants more computers than they need, taking up room.

ii) Who wants to keep unplugging printers monitors etc so that they can swap them between machines (I know there are switches but...).

iii) The ST hardware emulators run faster than a $400 dollar PC as at least 2 of them use the V30 at 8MHz (cheap PCs here in the UK run slower than that).

iv) ST users with a hard disk can use it for the PC emulator, I'm sure that the $400 PC does not have a hard disk. This allows easy transfer between PC and ST applications.

Anyway onto the product, I recently bought Supercharger, I considered PC-speed as it had AT&T 640x400 mono screen emulation (making better use of the SM124) however from my point of view the fact that SC could take a maths co-processor was the deciding factor. I did not concider PC-Ditto II as here anyway (UK) it is not yet available.

The product is well made in Germany (at least the European ones are) by Siemens so it has a good pedigree, opening the case shows a beautiful circuit board with a slot for an 8087 (soon filled) and space to take RAM upto 1 MEG (also soon filled). There is also an expansion port which I believe will soon be able to take PC cards (they are working on a special surface mounted VGA one to fit inside the box). It comes with MS-Dos 4.0 and the standard screen emulation is CGA.

The major attraction of SC however is the ease of installation, it simply plugs into the DMA and you are away. This in fact is where the only problem arises, and that is that you have to hold down the SC's RESET switch (on the front) when booting otherwise the hard disk reports an error (at least my ICD one does).

Anyway as you can tell I am quite pleased so if anyone wants any more info drop me a line.

Phil Woodall

Woodallp@uk.ac.bham.vax1

p.s. Oh yes compatibility is good too, nothing yet does not work.

255. xxed --looking for binaries

In response to my response to an ST flame...

I only call people names when appropriate, I'm not going to knock a great computer, only the attitude of its owner...

It's getting even more moot these days. The STE appears to have everything the Amiga originally had over it in a slightly less elegant fashion, and this makes the price difference even more questionable...

If only the dimbops would advertise the thing on MTV like the smart people at Commodore. I shouldn't complain though, at least they aren't trying to sell the Lynx by word of mouth (yeah I know about the Amiga/Lynx connection, I LOVE that!)

What I really wish would happen is that Apple recruit Atari to make a mac for the home market. The real expertise Atari has is in making hardware dirt cheap. Yes, the Stacy is just that, but if Atari doesn't push the thing, it won't make a gnat's yeast infection of a difference...

Commodore deserves to dominate the desktop video market. They entered it the same time as atari, but unlike atari, they supported it, rather than get lost in their own machinations, confusing everyone...
My reply was only to the dimwit who aimlessly blasted the ST because of obvious insecurity over the size of his peripherals, rather than actually spouting some truth about the Amiga's dominance of desktop video...

Message-ID: <9001100548.AA07000@TIS.COM>
Source record: 244952

Oops, I screwed up. As Allan Pratt and Dave Berger have pointed out,
you can't call GEMDOS from within a process termination handler. So
ignore the new _gemdos hook in my original posting. It most definitely
will not work. The _bios and _xbios hooks are fine, though.

Sorry 'bout that.

RE; Postscript cart for HP Laser Jet IIP

I am have been using the HP Laser Jet IIP with 512 K memory for several months. I don't realy miss the postscript. In Mac mode with Spectre GCR, I use Adobe Type Manager program which very good print out. In Atari mode the Page Stream and Calamus program provide scalable outline font for the printer. What I miss is the Epson Emulator to print the graphics from Degas and 1st Word Plus.

Does anybody have the Epson Emulator program (similar to the one for SLM804) for the IIP? Another thing I would like to experiment with is to connect the IIP to Atari DMA port a la SLM804 as the printing of Calamus is very very slow with the present parallel interface. Has anyone try or look into the possibi-lity of connecting the SLM804 Printer interce/control box to the IIP? IMHO I think that this box is a conversion for SLM804 Parallel to DMA. S.Sujarittanont

261. Re: TOS 1.6...

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 08:08:20 UTC

Hello all,

In Info-Atari16 Digest #16, cca.ucsf.edu!wet!nut@cgl.ucsf.edu (adam tilghman) writes:

> After reading several descriptions of TOS 1.6, it sounds like it would not
>be an impossibility to drop a 68030 into a 1.6-equipped machine. Will Atari
>market 1.6 to us 1.0-1.4 peoples for that purpose? I like my Mega and do
>not plan on upgrading to an STe (for the same reasons that I sold my 1040).
>I realise that this is not exactly an easy question for those Atari
>employees on the net, as it is more a legal issue than a technical one =:(

Sorry, but this technically impossible. The 1.6 version is bigger than the available ROM space in a regular ST/Mega, and is installed at a different location in the CPU address space.

Also, I doubt that 1.6 checks for CPUs other than a 68000. TOS 3.0, on the other hand, does just what you want. 3.0 is the TOS that comes with the TT. It won't work in STs for the same reasons.

The only way you still can achieve your goal of having an '020 or '030 in your machine is to take TOS 1.4, disassemble it, fix the '020/'030 problems and reassemble it. This works just fine, but it is a bit of work. As a side effect, GEM is 9 % faster using an 68000 (haven't measured other performances yet), and the ROM code size is decreased by several KB, giving you space to add some extra goodies on your own. While you're at it, you can fix all of those (known) bugs that still lurk in there. Of course, programs that illegaly use hardcoded ROM addresses will fail, but I haven't found such a program yet, at least not one that I'd miss.

In Germany, this is entirely legal, as long as you don't distribute such a TOS to others (without written permission from Atari, which is probably hard to get :-) Me, all I need is an affordable 68030 board, like the one recently discussed here (if I remember correctly, Dave Small was one of the developers, but he has been silent on that topic for some while).

264. Re: How do I add a window to a form?

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 10:11:23 UTC
From: RiddCJ@computer-science.birmingham.ac.UK
Message-ID: <9001101011.aa01318@benjamin.Cs.Bham.AC.UK>
Source record: 244958

Paul Close asked (paraphrased):
1) how do I put a scrollbar in a form (dialog) like the file selector?
2) how do I write inside a window?

1) Well, you CAN'T put a window inside a dialog box. What you can do though, is simulate a window's scrollbars and features by drawing little buttons (hint - use G_BOXCHARs for the scroll arrows) and boxes (the scrollbar background should be a G_BOX with a fill pattern, the little moveable box (thumb) should be a child of this object, and should also be a G_BOX, filled in white). Play around with a good resource editor (K-Resource or WERCS spring to mind).

All the objects should have the TOUCHEXIT flag turned on, so that a mouse click will 'repeat'. You'll need a little bit of code to handle all the different click positions - on the thumb (drag the box), on the background (page the thumb up or down), or just scrolling line by line up or down. You don't need to use G_PROGDEF types.

2) You can write inside a window just by writing on the screen at the proper coordinates. To ensure that you don't destroy the screen outside the window, clip the VDI output to inside the window's work area. There is no other way. There are alas, no extra window functions inside the AES that will help you do clever things. You need to work hard! After a bit, you get to admire the work that's gone into packages like NeoDesk (custom windows) et al.

>> My mouse is dying and I need to replace it fast. Can anyone recommend one
>> cable. The arrow moves in the opposite direction of what I want, sometimes.
>> I shake the cord a little, and it will work OK for a short time. Can I
>> cheaply replace/build a new cable?

This problem can occur if one of the wires inside the cable is broken.
(There seems to be a favorite place for them to break, about an inch
outside the mouse.) You might be able to get a replacement cord from
someplace that repairs Atari. (I thought about rebuilding mine, but
couldn't find either an appropriate strain-relief, or a source of the
fiddly little connector used to attach the cable to the board inside
the mouse.)

You can also get this effect (it follows) if your mouse socket in the
ST is lifting from the board and so breaking a connection (apparently
not too uncommon if you unplug the mouse a lot, to put a joystick into
that port) or if the mouse is not firmly, all-the-way, plugged into the
ST. Check that first, it's easier; my mouse often wiggles loose. If
you plug/unplug the mouse a lot, get a switchbox, or even just a
joystick extension cable (Tandy/Radio Shack) and do the swap at the end
of that.

If you go for a third party mouse, be careful about the ones with
switches that make a loud click. They tend to have metal domes which
deform under pressure (like the little metal 'cricket clickers') and
will die from metal fatigue under heavy use. Probably OK for 'serious'
use, where you don't click a LOT, but I've killed 2 such (different
makes) playing Populous. (Anybody know a good, durable, light button
touch, 'GAMES' mouse?) My dead ones where a Kempston mouse, and one
labeled 'Conniver' or something like that. These might be UK-specific
brand names. I'm tempted to try modifying the shell of the Kempston
mouse, which is very nice for 'serious' use, so I can install heavy-duty
microswitches. Nothing to lose, after all...

271. Tempus II

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 14:29:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9001122253.AA25515@ucbvax.Berkeley.EDU>
Source record: 244964

As a heavy user of Tempus II and the Universal Item selector I have
been plagued by the following problems:

1). Tempus' Item Selector, while it was great when first introduced,
has been supplanted by Universal or, to a lesser extent, the built-in
item selector under TOS 1.4. Could we get the Tempus people to abandon
their item selector or at least provide a configuration option that
allows use of whatever happens to be resident in the system, as the new
WordPerfect does?

With the Tempus item selector one has to take extra steps to get past 6
logical drives. Universal provides capabilities like delete, copy,
rename, format, print, touch, ...which are very handy when doing
editing. While it is true that the UIS can always be brought up as a
desk accessory it would seem very convenient to also have it available
for loads, block saves, etc.

2) Tempus' scroll bars interact with the scroll bars and buttons on UIS
such that any UIS item that happens to overlay a Tempus scroll bar
fails to function. This can create a serious problem if the horizontal
scroll bar for an active window happens to lie beneath the "Cancel"
button on the UIS. I have seen this problem in TOS 1.4 and TOS 1.2.
Has anyone else seen it? This seems to imply that Tempus replaces
certain GEM functions in a non-standard manner, which is greatly to be
deprecated.

3) Tempus does not provide hot-key reminders on its drop-down menus.
This would be a really nice feature to have because Tempus does make
effective use of hot-keys. I recognize that the fact that Tempus' key
bindings are user-selectable may be a problem but it would seem to me
that the text strings for the menu entries could be rewritten when
Tempus recompiles its bindings. Since Tempus does not use a separate
resource file to hold data for menus and the like this would mean
modifying the executable image of the program, which should not be too
difficult.

4). Perhaps the Tempus developers could also provide online help via
the Help Key.

Tempus II is by far the most satisfactory line-oriented editing program
that I have used on the ST. I would hope that its developer would be
responsive to these very minor problems. I would gladly pay another
$25 or 30 for an upgrade to enhance the value of this fine program.

If anyone out there in Net-Land has contacts with the Tempus developers
I would appreciate it if they could forward this to the responsible

people. I do not find it useful to take problems like these to Michtron, the US distributor.

Please keep me posted via E-Mail on anything that develops out of this message. I would be interested in other folks' reactions to these suggestions in the spirit of evolving sound standards for the development of a coherent "look and feel" for ST applications programs.

272. Parochialism in the Worlds of ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 14:31:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9001122253.AA25532@ucbvax.Berkeley.EDU>
Source record: 244965

There has been enough traffic from the "loneliness...." message thread to raise the following issues:

1). What are the factors that retard the movement of the wonderful software that we hear of in Europe, the true home of the Atari ST, across the Atlantic to the underdeveloped reaches of the USA and Canada?

2). How many different kinds of ST's are there? This may seem naive but are German ST's, English ST's, French ST's, Canadian ST's etc... that different from each other and from those in the USA? If so, Why? If this is true of ST's is it also true of PC Clones and Macintoshes?

3). What barriers exist to the migration of software and hardware into Europe? What obstacles other than his own simple ignorance would an outside developer face if he tried to market in Europe?

4). We often hear that ST's are taken more seriously for professional, academic, and scientific use in Europe. Is this still true?

5). Problems with RFI suppression have been cited as the most frequent cause of delays for the introduction of new products into the US market. Are these standards different in Europe and the US? If so what are the differences? Is there a common standard that could serve as the benchamrk for RFI suppression engineering?

I am sure that others can think of other questions in a similar vein. I have offered this topic in the spirit of initiating a dialog which could, if the outcome were taken to heart, lead to a more unified approach to the Atari marketplace to replace the fragmented approach we see today.

While it is difficult to separate institutional factors from technical issues, it would be desirable to be as objective as possible in this discussion. Isolated personal experiences should be eschewed in favor of globally valid descriptions.

It might also be possible to identify areas of possible transatlantic collaboration in such areas as translation of documentation, standards development, and software testing that could help to break the ice. This may just be another gasp from a superannuated Candide, but I am seriously interested in seeing improved computing on both sides of the pond.

>undergraduate EE majors can fix it?

Well I have fixed several Atari St Machines and upgraded many of them.
The cause of the power failure could be anything from grounding out
the disk drive connector to the Dma port etc over a period of time.
Most likely the cause was a cold solder joint that over time heated
up and then had no connection. These cold solder joints can be located
at various spots but from experience near C10 C11 or where any of the
wires that enter or exit the power supply board. I have had to replace
a leaky capacitor at c13 and a fuse time to time(normally due to improper
disconnection of the power supply). Regardless before sending it off look
high an low for a cold solder joint on the power supply board.

If you require any more assistance send me mail and Ill see how I can help.

Hello everyone,

I am looking for information for various picture formats, for both
the ST and other computers.. Specifically for the ST, I am looking for
PD C or Assembly source code to display Spectrum pictures. I hav e
seen several programs that display SPC pics, but I'm not quite
experienced enough on the ST (yet!) to write my own Spectrum display
algorithm..

I also need the GIF format (it's not in the Picture Formats file
that was posted recently), any 8-bit formats (Koala, Micropainters,
etc..), and any Mac format(s). (just the description of these
should be fine)..

Also, what ever happened to PicSwitch? The latest version I saw
was 0.7, with a promise of a newer release. Well, that never seemed
to happen! Is the source code available?? Is the author on the
net? (sorry, I'm not on my ST or I'd look to see who he is)..

Thanks for any help,

Sorry, but it is not PD but was released on a STart disk which is not
PD (but has this myth about being so).
Contact them at (415) 957-0886 if you want to order that issue. (Sorry,
couldn't find it off hand so I don't know which issue number that was).

I think Atari is a great machine. I love my ST and prefer it over any
other computer I can think of that I could afford to buy. Right now,
it seems to me like there is a hole in the computer market. C64 is
going out, and C128 never really was a big deal. There is nothing for
the person who doesn't know much about computers, doesn't WANT to know
much about computers, or doesn't NEED to know much about them.
Nothing for the casual home user who wants to play games and also do
some serious stuff on it. The Atari ST could fill this gap, but they
do not advertise. Half the people I ask do not even know what an ST
is. It is all well and good that things are different in NY and the
west coast, but tht isn't going to help Atari. Atari doesn't have a
bad image...right now, they have NO image.
You guys at Atari listening? I also think that advertising on MTV
is DUMB. But it would be smart to get more dealerships open across
the US...Buy advertisement in computer magazines. (I was happy to see
ATari ST mentioned in Computer Shopper)...support the product! And

get rid of some of these distributors that aren't getting products to
the dealers that they have...or should have...
Tell you what, Atari can hire me as a campaign manager for the US.
I'll accept the job for ...oh, to be generous...40,000 a year.

Hi all,

Hi there. I'm an ST user who has had his share of viruses. I must say, I am glad for things like Virus Killer 2.2. To get back to the point though, I have heard of things called antibodies, that sit in your boot sector and do something like flash the screen . The idea being that if a virus hits and writes over the antibody, you will notice the screen not flashing. Is there currently a program to install something like this out? What would be nice is a formatter that has this as an option. What would be nicer is if the makers of DCFORMAT would add this as an option...

I use 82 track/10 sectors-per-track disks with TOS 1.4 all the time, formatted with DC Formatter 3.2 (I paid the shareware due; it should be identical for this purpose to the latest PD version). No problems. Well, an occasional disk does fail, but they do that.

Could be a whacky drive... (I know, something you really didn't want to hear)
Or you have some really bad disks.

285. Atari ads, ad nausem....

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 16:44:54 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900110.10445243.002724@SFA.CP6>
Source record: 244978

Hello all,

After reading for months letters raking Atari for advertisements, or
the lack thereof, here is a little bit of opinion from East Texas, all
gleaned from reading mail from other nets.
The Amiga net is tough to follow. Several letters will be positive
over the national ads of six weeks ago, and, in a couple of days, those
same individuals will be scolded because they liked the ads. Those
scolding them will claim the ads didn't refer to the technical quality
and attributes of the machine and appealed to no one comparing machines.
Further moaning begins when others say that the ads didn't make that
much of a contribution in moving product. Conclusion on that particual
net was that the money used could have better been used for research, etc.
The Mac nets are also tough... sort of hard to find a Mac hacker
anymore. Apple has finally succeeded in shaping users to fit that box
instead of the other way around. Push a button, listen to it whirr. If
one has the money, then the Mac is a real nice appliance. What few hackers
are left for the Mac all question what System 7.0 *really* is, where Mac
is headed, and why constant advertisement is being done when money should
really be spent on better research to counter the IBM world. Their feelings
are that IBM is slowly becoming friendlier with an iconoclastic interface
shell and that the Mac advantage will soon be mute. National advertisement
campaigns are a waste, they say, aimed at the corporate market. In short,
they ask, "What was Apple talking about when they said: 'The computer for
the rest of us' ".
Atari..... To advertise or not? Advertise what? To buy from whom?
I am not a marketting person but I fail to see how advertising would help
in my area. I guess that there are no more than five STs within 200 miles
of me. My dealer is in Fort Worth, an ST mecca of sorts. He's small, has
two employees: himself and an electronics engineer. Makes a fortune
selling ST hardware and software...sometimes by appointment. He does his
own tv spots. He is very happy with Atari, at least he is making a nice
income. But for my area, how would a national campaign do any good? No
dealer to buy anything from.... it would be nice for me, though. I could
say to a stranger, "Yeah, I have an ST," and no one would say "whatzzat?"
So, I'm content with taking a four hour drive to Fort Worth for my ST
needs. If I had my druthers..... I'd druther drive across the street
like my Mac, IBM, and Amiga friends. But we have to look at our local
situation and go with it.
The advertisement campaign didn't really benefit Amiga, at least to
the level expected (U.S. folks want IBM [why, why, why???]). Mac
advertisements appeal more to the Yuppie (my opinion) and bank rather than
the hacker and home computerist, and that leaves Atari.
Speaking of hacking...I am disturbed that Atari engineers feel that

the home computer hacker, the guy who wants to software/hardware hack on his machine, no longer exits as a whole. This deeply bothers me. Did we (Apple, Atari, Commodore) lose this when we abandoned BASIC as our interface?
Personally, in my own very biased opinion.... and sorry about cluttering the net....: I'd rather see the ST market penetrate the schools and reps be hired strictly for education reasons. Music departments, desktop publishing, robotics. The ST can easily accomodate those areas in the schools. A push of the ST, with theoretical funding earmarked for national ads to be used for education instead, would do more in benefitting the machine, exposing the programmer and developer, and restoring home computing enthusiam than any national ad.
Somehow, seeing a former speaker of the house pushing a mouse button on a glaring color tv screen does NOTHING to me in wanting to buy that product.
If I were a 10th grader, participating in a music lab with MIDI theory and keyboards, I think that I'd have a problem in going home..I'd want to stay on the ST. Obviously, examples for the other disciplines abound.
Advertisement? Well, a fine concept. It is the American way, but examine the other systems and it will be found that advertisement just isn't as beneficial as one would expect particularly when the money could be used elsewhere. Sorry about the clutter and the above views are totally and strictly my own.

From: tim@brspyr1.BRS.Com
Message-ID: <6609@brspyr1.BRS.Com>
Source record: 244979

SCHMIDTM@CMR001.BITNET writes about problems running Opus 2.2 and getting it to accept the ASSIGN.SYS file.

I found that Opus is very particular about the ASSIGN file format. In particular, the device entries can't have anything extra around them, and device number MUST be 2 digits long. That is, the following line will not work:

1r screen.sys

But this one should be okay:

01r screen.sys

It may have also complained when the drivers selected used upper case (or the other way around -- I'm not at my system right now, so most if this is just vague recollection). Play with the device driver entries though, it took me several hours to get it right.

One of these days I'll get around to writing that ASSIGN.SYS file builder/maintainer I've been meaning to ... ah, well.

Atari Community.
****
Date: 14 DEC 89 14:01:53 CST
From: Z4648252 <Z4648252%SFAUSTIN.BITNET@forsythe.stanford.edu>
Subject: Emulating the Mac Plus via Spectre GCR

I've been requested to give an evaluation of the Spectre GCR,
the Atari ST Macintosh emulator.
I have access to a Mac SE FD/HD (a mouthful!) and am
constantly on both the Atari Spectre GCR Mac emulator and Mac so
hopefully, this evaluation will be of value. The Atari ST used
is a four megabyte ST equipped with a SeaGate 296n hard drive and
Atari paper-white 12" monitor. No accelerators are in use to
speed up this particular ST.
The Spectre uses Macintosh 128k ROMs and can emulate either a
Mac 512KE or Mac Plus. A key press will toggle either system.
All systems work, including 6.0.3. All ram has been surrendered
to the "Mac side" allowing some hefty applications to work
together via MultiFinder, i.e., FullWrite, Hypercard, RedRyder.
In fact, that is what is on the system right now. I'm typing
this with FullWrite, Hypercard and RedRyder lurking in
the background.
Hard drive support is a simple plug in and go via the Atari
ST's hard drive DMA port, therefore, data transfer is fast, if
not faster than the real thing, depending upon the hard drive
mechanism. External Macintosh hard drives also work.
Macintosh ramdisks work perfectly and, like the real Mac,
all but required if a one-drive system is used. This can help in
ending the Mac Floppy Shuffle.
Control Panel settings are not saved, therefore a Mac PD
utility, DiskParam, will do the job. It works perfectly and was
written by a Macintosher, Mr. Webb, who lost his Param circuit on
his Macintosh.
Because of the Atari ST's faster clock speed, graphics and
sound are noticeably faster. Sound is a touch "squeaky".
Graphics are snappier than that of a Plus and SE. Indeed, Aldus
FreeHand's self-running demo will be about four pages ahead of
the same demo on an SE after about two minutes into the demo.
Mouse handling is great and the mouse does not slow down
during disk access. Also, the ST mouse has two buttons. The left
is the standard "point and click" button, the right is a shift
key equivalent. This allows for selective file maintenance
without your having to touch the keyboard!

Floppy disk access is ok. The Spectre GCR can read Macintosh disks directly at the same speed as a real Mac if the ALTernate key is pressed prior to accessing the disk. Otherwise, the read attempt will sample the disk and check to see if it is an Atari (Spectre) or Mac disk. Pressing the ALTernate key will bypass the check. Writing is direct and since the disk has already been sampled when it was inserted, the emulator knows already whether the disk is Atari or Mac. Mac formating can be done along with duplication of real Mac disks. Again, there is no speed loss. Some STs are having problems writing to Mac disks due to a particular batch of drive mechanisms which think the Mac data is noise. However, these seem to have no problem writing to Mac disks via Spectre's own utility program. Again, the process is fast.

Although Spectre GCR can support Atari's RGB screen, the cheaper ($90.00 at some stores) and crisp paper-white Atari monochrome monitor is the best. It is 12" and uses 640 X 400 resolution. There is no flicker and the scan lines are barely seen. The display is clean and bright. The larger screen does not increase the size of the characters, instead the user has a greater viewing area close to that of the $400.00 Macintosh monochrome monitor. Gray scale, I think, is the same.

Memory allocation is transparent. The user will lose about 300k for emulation overhead. The rest is all his, if he wants it. Gee, I love this 3.5 meg or so of available memory!!!

Macintosh emulation on the Atari ST with the Spectre GCR has reached beyond the "hacker" level. For all practical purposes which include data I/O speed, program execution, and screen display, the ST becomes a Macintosh Plus, thus, greatly extending the use and power of the Atari ST and yet, with very little compromise for either Atari ST in its host mode or in "Mac" mode.

>[stuff deleted]

I would like to add my two-cents' worth to this discussion. I have used PC-Ditto extensively since it was first introduced, and am anxiously awaiting the arrival of PC-Ditto II to my door. (Anyone know the current status of the product?)

In places where I work (and have worked), PC's are of course dominant. The convenience of being able to bring any extra work home is unbeatable. This necessitates that I have PC compatibility at home. However, though clones are cheap, in the little trailer that I live in their is barely room for ONE computer system, much less two or three (if I also wanted a Mac). Therefore, an emulator that turns my present computer into one (or two!) other computers is indispensible.

So IMHO emulators are most useful for people who do not have a great deal of room to spare for multiple computer systems.

I don't think that this is too likely, though I suppose it is possible.

> Is it possible that electrical interference somewhere in
>my home can do this?

This, I think, is the more likely culprit. I remember reading an article in BYTE magazine some years ago where Jerry Pournelle was having similar problems. After going through serious contortions (much the same as you have) he decided to try shielding his parallel printer cable(s). After he had taken such steps to minimize electrical interference, the problems that he had simply vanished as mysteriously as they had begun.

> There is nothing in my manuals about how to deal with demonic
>possession.

If THIS is the problem, as I can suggest is that you get your system blessed by a Priest! ;-)

I hope this info will be of some use to you.

Subject: Printers (Laser)

Is it possible to drive a laserjet from an ST when the printer has only 512k
of ram, I require full page 300 dpi, I would have thought that this was not
possible with only this much ram. I require/will require to use with
Calam
Calamus(maybe anyway), GDOS, and Ultrascript, I cannot afford the extra ram or
an Atari laser (I only have a mega 2 anyway) so I was looking at the LJ IIP.
Otherwise I will just have to buy the DJ+ instead.

Thanks

Phil Woodall

295. Physbase vs. Logbase

Newsgroup: comp.sys.atari.st
Date: 1990-01-10 20:42:00 UTC
From: latornell@MECH.UBC.CA
Message-ID: <255*latornell@mech.ubc.ca>
Source record: 244989

```
In response to the question by:
John R. Dunning <jrd@STONY-BROOK.SCRC.Symbolics.COM>

regarding: Physbase vs Logbase

Physbase() is the XBIOS call to get the physical base address of the
screen while Logbase() is the call (also XBIOS) to get the logical
base address of the screen.

Physbase() returns a long that is the screen's physical address in
memory at te next vertical blank interupt after the call. Logbase()
immediately returns a long that is the screen's logical address. To
actually do anything with these call you need to know about
Setscreen() too.

Setscreen() has 3 arguments, log_base, phys_base and res. log_base
points to the screen buffer on which writes operate, phys_base points
to the buffer that is displayed. If they are the same then a write
operation will appear on the screen as it is done. If they are
different, you won't see the result of the write until you change the
physical base to show that logical screen. res sets the resolution.
A -1L for *_base or -1 for res leaves the current value unchanged.

Perhaps an example will make things clearer. I've used this to do
primitive animation, the sort where you flip back and forth between 2
screen buffers, displaying one while drawing the next frame on the
other. An outline of the code goes something like:

/* globals */
char *screen1, /* logical base of current screen */
*screen2; /* logical base of new screen */

set_bases()
{
long new_buffer;

new_buffer = Malloc(32256L);
/* some code to make sure new_buffer starts on
a half page boundary */
screen1 = Logbase();
screen2 = (char *)new_buffer;
}

main()
{
set_bases();
while( /* not stop animation condition */ )
```

```
{
/* show screen 1 while drawing on screen 2; leave res alone */
Setscreen(screen2, screen1, -1);
/* draw next frame */
....
/* show screen 2 while drawing on screen 1 */
Setscreen(screen1, screen2, -1);
/* draw next frame */
...
}
/* put logical ad physical bases back to original values */
Setscreen(screen1, screen1, -1);
/* release memory used for 2nd buffer */
Mfree(screen2);
}
```

Hope this helps. Check out Pollack and Weber, "Atari ST Application Programming", Bantam, 1987 for further details.

> Sorry, but it is not PD but was released on a STart disk which is not
>PD (but has this myth about being so).

ACtually, Ani-ST is "shareware", and was released to GEnie, for one, before it appeared on the STart disk. I believe that Jim Kent wanted a "smile" as payment ...

So, no, you do not have to buy the STart disk in order to obtain the Ani-ST program, but you may certainly do so.

Public domain programs have appeared in STart before, and are generally marked as such. Programs such as ST Writer may be freely copied, since STart magazine _cannot_ hold a copyright on the material. This does not mean that all programs on STart are PD, most of the are not. But in the case of Ani-ST and ST Writer, the programs are freely distributable ...

>other hand, does just what you want. 3.0 is the TOS that comes with the TT.
>It won't work in STs for the same reasons.

actually, darek mihocka and myself have an STE and we've disassembled the
exception handlers in TOS 1.6, and sure enough, it checks some
system variable which tells the software what type of stack frame it can
expect. therefore, if its a 68000 processor, it uses an offset begeinning
at 6 from the current stack pointer to get params, and if its an 010 or
higher, it uses an offset of 8. it does this in getting params, and also
for reconstructing stack frames, etc. so, in actuality, tos 1.6 does indeed
support cpus other than the 68000.

also, i remember vaguely reading some review in ST world on the STE when
it was unveiled at the dusseldorf show, and they were saying it was running
tos 1.6 at the time. but i could be wrong ...

I would rather have someone develop a universal archiving tool which
could dearchive many different formats and perhaps archive in all those
formats as well. There are trade-offs for all the compression methods and
I would rather not lose the freedom of choice.

Does someone want to develop such a universal archiving tool? Is it
worth it? I for one would have a use for such a program.

300. GEM windows programming problem

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 01:13:36 UTC
From: jg@hpldola.HP.COM
Message-ID: <11830069@hpldola.HP.COM>
Source record: 244994

Here is a GEM programming problem:

I've written a multiwindow GEM application, everything was fine until I added a "feature" that allows users to edit window data in a dialog box. The dialog box editing function allows the user to edit data that may appear in several windows that are currently open on the screen.

Here's the difficulty, when the dialog box closes, the window(s) receive a WM_REDRAW message which is fine, but data may have changed in an area of a window (or two, or three) that is not covered by the dialog box and therefore does not appear on the redraw rectangle list. When the uncovered part of the window(s) is redrawn the window data looks wrong because the part of the window that was not covered is old.

Solutions and commentary:

1) When traversing the rectangle list set the clipping area to the whole window instead of the just the covered part, then draw the entire window's data.

results: YECH. This doesn't work because the windows are drawn in somewhat random order (any ideas here?) and windows that are beneath other, already drawn windows may pop through them when drawn.

2) When the window(s) are "dirtied" (that is their data is changed), use appl_write() to send a redraw message for the entire desktop.

comments: I haven't tried this yet, but it seems pretty good. The questions that come to mind are:

a) will this new WM_REDRAW message get merged with the one from the dialog box closure? I know that redraw messages will get merged, I have used this before when I wanted to force a redraw whenever windows were sized (normally window sizing only causes a redraw event if one of the window's dimensions is increased).

b) Will this look bad even if the redraws are merged? I'll have to try this and see.

3) Variation on (2) above, send multiple redraw messages, one for each dirtied window.

Will these messages all get merged?

Anyway, any ideas and comments are appreciated!
-Joe Gilray

I have come across a somewhat serious deficiency with LHARC ... archives which contain directories cannot be transported from UNIX to the ST (the ST versions of LHARC and UNLZH do not convert from / to \). I assume things do not work in the other direction either, but I have not tested that as yet.

I will forward this on to the folks that handle the ST and UNIX versions that I have, but think everyone here should be aware of the problem.

Other than that, the disk savings of lharc are pretty impressive.

303. TOS 1.6 and the 68030

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 01:36:04 UTC
From: bradm@pro-grouch.cts.com
Message-ID: <1149@crash.cts.com>
Source record: 244997

I have heard rumors (God I hate rumors) that TOS 1.6 would allow the STe to work with an 68030 processor (and perhaps an 1040ST or Mega if outfited with 1.6). I would like to know if any of the Atari reps here on the net could comment on this. I have a friend who works for a company who makes 68030 boards for 'other' computers who could have an '030 board out for the ST way before another well publisized project (Hi Dave :-)). If this is not true, I will have to convince them that they want to write the software to make it compatable (how would you like to have you ST running at 40mhz?).

> and that is where I need help.

Larry,
I was interested in doing the same thing; at one point I even turned the backpanel "inside-out" but this didn't help much either. Finally I decided to go with more HDs. In a regular clone case, using a couple of stacked and smaller power supplies, I have managed to get two 5.25" HH HDs, one FH 5.25" HD along with two Adaptec 4000 and an ICD host adapter, as well as a FH 5.2" 80Trk floppy into this thing. Oh yes, and a fan. Believe it or not, I still have room to add another 5.25" HH HD or a couple of 3.5" HDs. None of this could be done with the original backpanel, so I just made a custom one from a heavy sheet of aluminum.
Everything looks just fine with my Mega2 stacked on top. Besides, unless your system will regularly be viewed from the rear, why worry about the backpanel not being identical to a clone?

Cheers,
Pierre Fortin

> Personal taste, of course.

There are some obvious good/bad points to "any" emulations (to date?)
In that One can use ONE computer and use the widest Range of software.
And, it's generally cheaper than buyin the real McCoys. In the case of
the PC, I agree, it's ridiculous to spend $300-$500 for a box that one
can buy for $300, and expand upon. And, PC prices still are not stabalized.
386's are comin way down, and 286's are BEST buys. In the case of the Mac,
Mac's are not cheap... Disadvantages are the lack of expanibility with
hardware (or shall I say of?). Someday, maybe Risc or some such nifty
gizmo will provide the best of all worlds. Myself, Well, When Dave Small
releases the latest version of the Spectre (the one that runs multifinder)
I'm gonna spring for one I think. It's simply a great buy. What I REALLY
wish is that apple would price down some stuff so "the rest of us" can
afford to expand/purchase/propogate the Mac. It's a great lil' machine.
And, an excellant example of what can REALLY be done w/ great software
engineering (as is the spectre). Also, I use Macs frequently, and its
frustrating not being able to afford the "usable" mac. BTW Dave, if you
see this! I have a few Qwik Questions about GCR.
1> Will GCR "ever" support the "coming!" System 7.0 software?
2> Does it have an extender port (for my Deskcart! <- When you help write it,
it's always "there" know what I mean? hehehe)
3> Will GCR ever "evolve" in step w/ Macs (a totally inane questions, but
I'm curious about it's future).
4> Does Think C run under GCR? (ie: The re-bugger uses MultiFinder)
5> Since I'm delving into Macdom more & more, how much Ram /HD does GCR
support?
6> I have an idea for a REAL ST winner (Maybe?). And, I have decided not
to code it. Maybe you'd be interested dave?

>

It's always been my OPINION that the internal power supplies found in ST
computers have been wimpy. Yours may have just gotten overloaded or
something. Who knows. What we DO know is that it is dead.

Is it worth putting another one in? I'd say no. Try something else.

I have my 520, 2 drives, and XE hooked up to a single power supply.
It's a nifty no-RF unit I picked up from Computer Software Services (the
8-bit folks who manufacture the SUPER ARCHIVER and BLACK BOX). It puts
out 5V @12A, 12V @1.5A, and -12V@ .5A. If you'd be interested in it,
give em a call: 716-586-5545. It's $80 or so, but it's worth it. You
won't have to worry about wimpy power supplies.

I've never seen how Atari has the internal power supply hooked up.
Whether it is done with wires, or terminals soldered right to the
motherboard, I don't know. The external supply is certainly less than
$200, and you won't have to wait 6 weeks for it.

You might also try Best Electronics. They can probably set you up with
a new Mega supply. The part number is : CB101507. No price listed.
As for replacing it yourself, it should be quite easy.

>pieces that will fit the cartridge port.

Yes. Douglas Electronics, 718 Marina Blvd, San Leandro Ca 94577: 415-483-8770
Their cartridge port connector is part 33-DE-40, priced at $10.00 the last time I bought one a year ago; they take credit cards.

Their connector is a board about 3" x 5" with the connector at one end and enough room for a few ICs and/or a 40-pin flat cable connector.

310. Design for MIDI-to-RS485 translator

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 05:47:28 UTC
From: jpexg@wheaties.ai.mit.edu
Message-ID: <5851@rice-chex.ai.mit.edu>
Source record: 244804

I'm using the MIDI port to communicate with a network (only 2 so far) of microprocessors (Intel 8031) using RS485 protocol. This is a two-wire-plus-ground differential line setup using half-duplex mode (ie, the same bus is used for bidirectional data, hence only one party can transmit at a time).

The circuit for the level translator is available if anyone wants it.

John Purbrick

311. Re: LHARC sources on Sys V

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 06:58:03 UTC
From: bammi@dsrgsun.ces.CWRU.Edu
Message-ID: <BAMMI.90Jan11015405@dsrgsun.ces.CWRU.Edu>
Source record: 244805

to anyone who may be interested: the LHARC sources recently posted compiles and runs just fine under TOS when compiled with tos-Gcc. Some minor adjustments were needed (for 16/32 bit ints), ftruncate() was pretty easy to simulate. the resulting code is a little smaller than the Lharc that was posted to comp.binaries.atari.st, and it runs much quicker too (though its no speed demon, due to the way lzhuf.c is coded). Unlike the Lharc for St that was posted, and the recently posted unlzh12, this one handles path names, creating folders etc correctly. i personally still prefer zoo.

bill shroka (our local archives expert) is currently looking into speeding up things. he also did an excellent port of zoo to Gcc. his port is sigificantly faster than the turbo-c compiled one that was posted to the net, and has all the extra St features also implemented.

I have an Atari MC68881 board fitted to my Mega. The chip is rated at
16Mhz. I use Prospero Fortran & Pascal who also supply the 68881
drivers. It really makes the ST fly on the numeric intensive ops..
I am hoping to get a 16Mhz 68000 installed at some stage. This
should make for a more interesting machine.

I got the board from SDL which is the education arm of Silica Shop.
The board cost 120 pounds sterling about a year ago.

Address:- Silica Shop
1-4 Mews,
Hatherley Road,
Sidcup,
Kent DA14 4DX.

317. Hello Atari USA Netters

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 14:47:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <9001130809.AA27847@ucbvax.Berkeley.EDU>
Source record: 244811

If any on the technical staff of Atari USA who read and post on the net (Pratt, Townshend, etc.) get this message, could he/she pass it on to someone at Atari USA who could answer the following questions?

1. When is the ABC286/30 going to be available in Canada (Atari Canada cannot give a date an suggested I contact Atari USA)? Is it in stores in the USA?

2. When will the LYNX hit Canada? What about STACY?

3. When the STE was demonstrated at COMDEX in Vegas, were there codes that took advantage of the new sound/colour capabilities of the STE? Are any demo codes available for distributions (two STEs in the local area look and act just like std 1040STFMs and the users would like to see something that shows off the features of their equipment)?

When a SAVE DESKTOP is done on the old ST in med res., the system will boot up in med res. Not so with the STE, it still comes up in low res. Is this a TOS 1.6 (1.4) bug?

>install something like this out?

There are two such "anti-virus" programs that I have copies of.
One spreads itself across disks, just like a virus would. That is,
in my opinion, unacceptable.

The other can be manually installed on a disk, and will do something
like what you ask. I can post it, after I find time to set up a
reasonable install program. It will take a little while, though, since
I'm a little short on spare time...

319. STE problem

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 16:43:42 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1990Jan11.164342.15604@newcastle.ac.uk>
Source record: 244813

I think I have found a bug in the STE. When booting from a floppy with a colour display, the machine allways comes up in low res. The window positions etc are correct however if the res is then changed to medium. This problem happens when using a desktop.inf saved on the STE and with the file saved on a TOS1.2 ST.

Anybody know a way around this?

On the compatability front the only program I have found that will not run on the STE is palace software's Barbarian.

Dave Halliday.

This is what serious developers do when source to critical parts of an OS isn't made available, and when the documentation is sparse (in case there's any confusion, I think it's a good thing to do under the circumstances, as long as it doesn't lead to use of version-specific and accidental features. I attach no moral color, good or bad to Atari's reluctance to disclose TOS source to registered developers. The sparse documentation is unfortunate, but not evil). My point is that all the stuff Atari hopes to prevent by keeping the source confidential, even from those who have signed non-disclosure agreements can happen anyway. Here we have 2 people who've earned a reputation as cautious programmers doing their own dissembly. Guys with PC game experience and a lot less caution can do the same. On any timescale I can imagine, it would be better for Atari and its customers if developers had an easy way to check EXACTLY what TOS would do in a given situation (and any commented source, no matter how 'ugly', beats a dissassembly).

321. CTS bug

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 18:26:33 UTC
From: squibby@eleazar.dartmouth.edu
Message-ID: <18443@dartvax.Dartmouth.EDU>
Source record: 244815

I have run in to a problem with the CTS bug metioned in Abacus's
ST internals. Supposedly the OS (where is not mentioned) requires
the CTS line to jiggle after each bye sent. I'm just switching to
a system that uses full duplex, GND and DTD lines and ties the
RTS (ready to send), CTS(clear to send) and pin 6 whatever that is.

I'm using a 520STfm recieved may 89 with uniterm and EMULATOR.ACC

Is there a fix. Has this already been fixed and I have something else
wrong. Will this be a problem with Magic Sac/Spectre?

Thanks, Clark

> was like.

Yeah, me too and I have 1.0 and 1.1. The really disappointing this is that rather than fix what is wrong, new features are added. PP 1.01 does essentially what we need to do. Nothing fancy. We use it to lay out some of our advertising flyers. All of our "real" publishing work is done on the UNIX systems.

But, each new version of PP (now PS) adds a whole bunch of stuff plus some new bugs. I have looked at the options and still don't have the right answer. FleetStreet 2.0 lacks some stuff. I don't know if 3.0 is good or not. Calamus is wonderful -- I have played with it -- but I need PostScript output as we ultimately send stuff to a Linotronic.

That does seem to be a problem that the docs don't point to. Dunno why
they did things that way... I'd fix it, but don't have the 6.02 sources.
(Deep sigh. }-)

>.complaining off
>
>Another one, which is more of a *real* (and heavy) bug:
>Arc lost it's capability of dealing with overlong filenames.

Well, it was pretty non-standard anyway, and the main idea was to maintain
compatibility with the PC version of ARC. (But it was certainly trivial to
allow for arbitrarily long names, really.) The official "fix" I posted for
the Unix side was to make it automatically truncate long names to fit into
12 characters. So it goes. You could easily add back in the code to allow
for long names though. Dunno what you'd do with them when you try to extract
them, but at least it wouldn't choke...

> seen this bug, and if you use this patch program, you never will.

Allan,

I use an editor on my ST which used to handle files larger than
available memory. It used to work on tos 1.0, the other day I was
editing something that was larger than available memory with tos 1.4
and my system hung, and printed a three line message at the top of
the screen telling me about memory problems, and I should use
foldrxxx.prg. Is this message possibly coming out TOS? I kind of
get the impression it is. If so, is this the bug you are fixing
with your patch, and if so, is it really necessary to still use
foldrxxx.prg even with tos 1.4?

thanks

>ANYTHING and ATARI-US denied the '881s existance.

I can't imagine why they did that.

Atari has a product, the SFP004, which is a 68881 peripheral for a Mega.
It only works with Megas, not 1040s, which may have been the source
of the confusion. It comes with a library (and source!) for linking
Alcyon C programs which use floating point so they use the 68881
if it's there, and use the old software routines if it's not.

Once you have this technical document and a 68881 chip, how do you
propose to weld the chip into your 1040? It's a nontrivial
undertaking. The SFP004 plugs into the internal Mega expansion bus. If
you do manage to weld a 68881 onto a 1040, please try to make sure it
addresses at the same place as the SFP004: the base address is $FFFA40.

By hardware you can open it up and tweak some potentiometers inside to expand the video image.. By software, probably the nicer way to go, you can get the OVERSCAN software and *use* that black frame for more pixels. 688x480 on a fresh-out-of-the-box SM124.

I just grabbed and installed poolfix.prg (which apratt posted <thanks!>), and have come across one minor problem.

It and Neodesk 2.05 don't get along at all. Everything works fine from the desktop. This is true with and without shel_fix.prg.

I just had some problems with my ROM chips (the dealer who installed them did a pretty lousy job; chips are NOT supposed to be crooked), and I'm _pretty_ sure I reseated them OK. In short, can anybody confirm this?

Two quick questions:

1) Where is this software? I can do anonymous ftp, so a site name would be
muchly appreciated.

2) Do ST programs such as PageStream recognize this? Or, better yet (?),
Spectre GCR?

(hope my .signature file works this time)

>compatable

Well, I too work for a company that makes 68030 boards, though not likely to ever produce ST boards. :-) Now I don't know how TOS is written but I can tell you what the difference in the processors are.

All user-mode instructions, as opposed to supervisor-mode, are fully upwardly compatible from the 68000 up to the 68040. Except for the MOVE <ea>,SR instruction of the 68000 which is now executable only in supervisor mode on 68010+ processors.

This however can be easely fixed through software. Executing this instruction in user mode on 68010+ processors will cause a priviledge violation exception, and an exception software handler can substitue the right code there.

Another difference between the 68000 and 68010+ processors is the exception stack frame created during an exception, such as interrupts. The differences are small and well documented, but they have to be taken into account anyway. If Atari provides source code to its OS, then fixing this should be no problem, particularly on 68030+'s. You see, the 68030 has a built-in MMU, thus allowing you to load a fake image of ROM in RAM and then translating all memory accesses to the ROM area to the RAM area.

If source code to the OS is not provided, you're screwed, unless the OS already takes account of the different exception stack frames created on the different processors. You can probably disassemble the exception processing code yourself, since the exception processing routines have their pointers starting at location 8.

Of course, software which depends on busy-waiting timing loops will be completely out of wack. So even if you get your act together, that does not mean that third party software out there does too.

(how would you like to have you ST running at 40mhz?).

Don't hold your breath. Even if you get a processor running at 40MHz, the rest of the hardware will not. You would have to provide your own 32-bit memory board to go along the 68030, and it will not be accessible to the blitter or any other

device at high speeds.

By the way, if your friend's company would like to make a board for this 'other' computer I work on, you know who to have him contact. :-)

> and especially where you got the driver for the PAINTJET!!!???
>
> This MAY change my mind.....(from LJ-II to PJ)...

Let me talk about the ways ST programs talk to printers, and then let's
see how these ways relate to the HP Paintjet, OK?

The first and simplest way is for the program to use the text mode of
your printer only, and forget about the graphics mode. You get to tell the
program what escape sequences it needs to print bold, italics, compressed,
etc., but the important thing is, you're limited to the printer's own
internal fonts and capabilities in text mode.

First Word and Wordwriter ST are examples of programs that fall into this
category. If you'd be happy with a 10-point Letter Gothic font, which is
a font that the Paintjet has built in, then using one of these programs
will produce 180-dpi NLQ text mighty speedily. And besides the black text,
you can print colored text in 6 other colors. You can do this by mapping some
Wordwriter ST modes to color escape sequences, e.g., I mapped the light,
superscript, and subscript modes (which I don't use) to red, blue, and green.
Anyway, writing a driver for these types of programs is easy.

The second way a program can print is to use GDOS along with the graphics
mode of the printer. So, if you need fancy fonts, you specify them in your
ASSIGN.SYS file, and GDOS will map them to the best possible resolution
for your printer. EasyDraw, Timeworks DTP, and Wordup are all examples of
programs that use GDOS for output. Alas, there is no GDOS driver for the
Paintjet, to my knowledge. If programs like these are important to you,
don't buy the Paintjet! (I have the HP Deskjet also, and, fortunately,
both Neocept and Migraph have very good GDOS drivers for the Deskjet/Laserjet
series; if 300 dpi laser quality output is important to you, get one of
these printers instead.)

A third way a program can print is to use the graphics mode of your
printer, but bypass GDOS, and use its own graphics-producing schemes.
Pagestream 1.8 is in this category. It comes with a whole slew of printer
drivers including an excellent one for the Paintjet. This program is
powerful enough to be a wordprocessor and object-oriented drawing program
all by itself, not to mention it's excellent page layout capabilities.
But what really makes it stand out is it's ability to represent hundreds
of colors internally, import Degas, Neo, and Amiga HAM format color
pictures with the palettes intact, and print them beautifully to the Paintjet.
It also has a color postscript driver for people with color postscript

printers. Not only that, it comes with outline fonts (not bitmapped) so you can get arbitrarily big, tall letters with no additional disk space!

Summary: If you really need brilliant color output and 180 dpi text in the same device, get the Paintjet. You can use the programs I mentioned, and you'll be happy. If you need a printer that has good GDOS support, and color is not important but 300 dpi laser quality is, get the Deskjet/Laserjet.

334. nethack 3pl6 for atarist

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 20:52:17 UTC
From: ret@rti.UUCP
Message-ID: <3411@rti.UUCP>
Source record: 244828

Hello, I am looking for a site that has nethack for an atari
st with patches through level 6 applied. The two sites I have
found, panarthea and ncsu, only have patches through level 3.
If sites are not available could some kind soul contact
me through e-mail about transferring the file.
I would be most appreciative.

address ret@rti.rti.org

thanks.

335. LHARC source not all that portable

Newsgroup: comp.sys.atari.st
Date: 1990-01-11 21:09:25 UTC
From: dag@per2.UUCP
Message-ID: <891@per2.UUCP>
Source record: 244829

The sources to LHARC posted recently to comp.sources.atari.st are not
all that portable across *nix systems. There is a routine gettz() in
lharc.c that is specific to BSD4.X, and the use of ftruncate, mkdir,
rmdir, and rename is not flagged as a system dependency.

The routine gettz() uses structures and a subroutine call which are
not available on many systems, and it is unclear from the code if
they are required for proper operation.

The routines ftruncate(), rename(), mkdir(), and rmdir() are used.
On older Unix systems (binary license) these routines are not available
in the standard libraries.

Before people move to LHARC format wholesale, a version of the lharc sources
should be created which is portable to a larger number of *nix varients.

From: nelson@kodak.UUCP
Message-ID: <2263@kodak.UUCP>
Source record: 244831

Another bug I found in arc 6.02 is the definition of the "p" command:

p = copy files from archive to standard output

Arc 6.02 prints the file to the line printer. Previous versions (5.21 and earlier) outputted the file to the screen or could be redirected via the ">" operator.

If anyone near Phoneix could point this out to Darin Wayrynen on his bbs (Next Gen BBS (602) 938-8288) I'd appreciate it.

| boards for 'other' computers who could have an '030 board out for the ST way
| before another well publisized project (Hi Dave :-)).

68030 expansions that work on other computers may or may not work on the ST - Jim Allen and Dave Small know this all too well. The ST has some unique hardware glue problems that make it tough to step into the 68000's shoes (or pads, as it were).

Don't you think that if the STE were completely 68030 compatible, and Atari could support it, that Atari would be crowing about that fact? What third parties can do with the machines shipped by Atari, and what _Atari_ can support on its machines are two vastly different categories of things. It is obviously doable, or Dave & Jim wouldn't have considered doing it. If any other hardware developers believe it's a worthwhile project, they are welcome to contact Atari developer support, and Atari will give them as much help as possible.

>the future.
>

It's possible to write such program. However, it's pretty hard to write
a program to handle multiple format by itself with comfortable speed.

It's much easier to write a program to identify the compression format
and call appropriate compression program to handle the data file. Under UNIX,
this is trival as each of these four compression schemes has an unique 'magic'
number. The UNIX command `file' can be used for such application. If you add
following lines in the 'magic' file (/etc/magic), the command should be able
to identify the format of an compressed file:

```
0 short 0x1f9d compress(l) output
0 byte 0x1a arc(l) archive output
2 string -l lharc(l) archive output
20 long 0xdca7c4fd zoo(l) archive output
```

Note that the magic number for zoo is for Motorola 680x0 chips, the Intell
chips and VAX family (?) store the long integer in normal order. So the
number should 0xfdc4a7dc instead.

I'm not 100% sure the lharc magic string covers every format of lharc. Inside
lharc.c, there are four of them listed:

```
#define LZHUFF0_METHOD "-lh0-"
#define LZHUFF1_METHOD "-lh1-"
#define LARC4_METHOD "-lz4-"
#define LARC5_METHOD "-lz5-"
```

Alternatively, one can add these information to the magic file so `file' command
can even tell you which archive method lharc uses.

Normally physbase and logbase point to the same memory. If You
set one of them to another screen memory then what you see is
shown from Physbase() and what You draw (VDI etc.) is drawn to
Logbase(). That can be used for animation: Show one screen, draw
the next image to another, then flip the Screens.

I don't know much about finances, but couldn't a lot of these "losses" be actually just expenses incurred on the development of the new systems that are about to be released and that Atari will compensate for this with the increase in sales projected for the new systems. I would say Atari will easily make this up with the sale of the new systems.

Just my humble opinion,

We have 25 1040ST in house and had same problem. Four mices went back to
dealers, two have been replaced, two repaired, but the repair would not last
for more than a few days. So we decided to do it ourself, essentialy as above,
but with the following trick : the infra-red pair are mounted on a plastic
spring, and are supposed to be adjustable with the screw at the end, but as
long it is not soldered ... also the hole on the printedboard are metalized
which makes (un)soldering more difficult.

So : 1. unsolder completely the IR pair (4 wires) and pull it out of the
printed board. you may need special desoldering tools.

2. bind the 4 wires 90 degree horizontaly (carefuly !) near the diodes
use thin wire.

3. solder in place 4 small wires to the board at one end, and to the
diodes to the other end (far from the diodes)

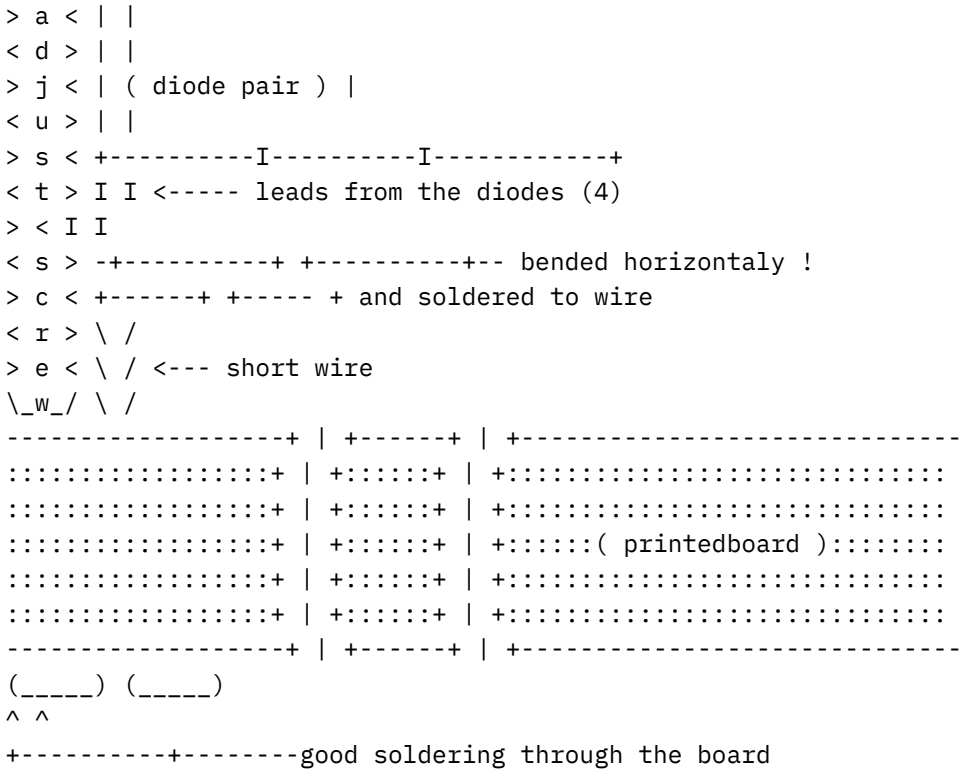
4. adjust the position of the diode pair with the screw (now that it is
free to move ...)

5. if you have an oscilloscope, check that the signal from the 2 diodes
are more or less shifted 90 degrees. At least, the cosine track
must come up and then down before the sine one, as this is used
by the logic to detect the direction of movement.

The mices we have repaired have been used now for quite some time and we never
had any trouble any more.

NB: do not try to adjust the screw with the diodes soldered in place, at most
you will destroy them ! Also take the usual precautions with integrated
circuit and static electricity ...

Here is more or less a cut through the board and diode pair. I hope it will
help save many mices !



God luck, and H a p p y N e w Y e a r !

> * Bob Slaughter * This space for rent *

Actually, a SuperSmart Do It All Archiver isn't needed. A friend of mine named Gerry Szekely of Detroit Michigan wrote a ShareWare program called "ARCIT SHELL" which handles ARC, LHARC, ZOO, ZIP all transparently from the same dialogue box. You select a button for the desired ARCing format and then ARCIT SHELL uses other buttons to build a command line to the desired program. I use it all the time.

And then there is the FAMOUS Charles Johnson's ARC SHELL program which is great for ARC and LHARC files.

And there is a new LZH dearchiver called UNLZH12 which is super fast for extracting files.

So, as long as there are excellent Shells (GEM-based shells I mean) I don't see why we need a overly complex do it all archiver. I would rather see a sharp programmer spend time on improving the existing LZH program. That would be of more immediate benefit to more users than a do it all program.

Another point is that a DO IT ALL program would freeze the archivers into a static state. I don't think that the ARC and LZH and ZOO and ZIP updates would as easily incorporated into a DO IT ALL than just a shell. A shell can normally use the newer archiver without change, witness the fact that ARC SHELL 2.0 worked fine with ARC 6.02, but w/o the new features of ARC 6.02. Then Charles Johnson updated ARC SHELL to ARC SHELL 2.1b and now it works fine with ARC 6.02. Pretty simple and quick.

So, for all of the above reasons I don't see a burning need for a DO IT ALL archviver. With the two fine shells mentioned above we can work with any archiver with ease now!!

About a month ago I found a new version of ZMODEM named ZMDM163 that attempts to fix the infamous Zmodem upload to Forem ST boards. Anyway, it does allow full speed uploads with the US Robotics HST 14400 modem (I have seen 1600 cps files uploads to a Forem ST board). But, the authors of this latest version did not leave their name of a way to connect them. Neither did they release the source code to their version 1.63. All I know is that they are called "The ST Enthusiats" (sp??).

There are two bugs in version 1.63 that I would like to correct. The first is that 1.63 fails to correctly start the upload transfer when you are uploading a file to a Forem ST board which has the older TOS 1.0/1.2 ROMS. 1.63 works fine when uploading to a Forem ST board running TOS 1.4 (haven't seen any boards with an STe running TOS 1.6 yet :-)). So, I need the source code to fix this.

Also, I would like to add other file extenders to the BINARY transfer mode, such as ZOO and ZIP. I keep losing ZOO files from my UNIX account when I use ZMODEM !!!

So, if anyone know who the "ST Enthusiats" are or if you have the source code to the ZMDM163 version please send me email!!

TIA.

I just tried MathCalc by Leo de Wit that was posted recently to
the binaries group. (Posting-number: Volume 9, Issue 10)

I think MathCalc is very nice, in fact one of the nicest calculators
for the Atari that I have seen.

It seems clear to me that Mr. de Wit has made up his own mind about
what to include in it, and has not just blindly followed the keyboard
layout and functionality of some other commercial product. The end
result is something interesting, powerful, and easy to use.

The package is a little short on the documentation, but it did
not take me long to figure out what some of his things were.

>> they didn't try to kill you; you are forced to kill them.
>> Am I missing something?

I avoid this by getting a docking computer. It docks so fast that
the cops don't get a chance at me. And this is the part I like best:
(Taken straight out of the manual) "It comes with MemnSomn pilot
interaction to induce hi-cram sleep during the manoevre."

>If somehow you lose your clean status, you can escape from your ship if
>you have purchased a life pod. The status stays with your ship, and you
>end up docked with a ship furnished exactly the same as the one you
>ditched (thanks to the "insurance policy" provided by the life pod
>purchase), minus the life pod.

This hasn't worked for me. Am I doing something wrong? I make sure
I don't carry any cargo, get into a fight, and then eject.
I get my ship back just as before, but my status is still bad.
What's going on?

>At various points in the game, after several hours of play, you'll be
>offered the opportunity to go on missions. The extra passenger room
>comes into play on one of these.

I thought I'd played a while, but I haven't seen this yet. Better
get cracking.

> [...]
> Hooks like this can be made reentrant by changing how they work:
> [example how to do it by copying the arguments]

There is another solution: use your own stack for saving the return address.
(This is also the method used in the ROM when bios is called.)

move.l stackpointer,a0
move.l (sp)+,-(a0)
move.l a0,stackpointer
trap #$x
move.l stackpointer,a0
move.l (a0)+,-(sp)
move.l a0,stackpointer
rts

You have to initialize the variable stackpointer to point to the upper end of
some memory space reserved for this new stack. Although this does only allow
a limited level of reentrancy (the stack-space divided by the amount needed for
every call), you don't have to copy your arguments around.

>I think I have found a bug in the STE. When booting from a floppy with a colour
>display, the machine allways comes up in low res. The window positions etc are

Iv'e attached a note from someone else (slightly edited) which describes two
fixes for this STE bug.

One bug I've found with the new 520STe is that it doesn't recal medium
resolution. I just spoke to Atari's help line and they say there are
two fixes for this.

One is edit DESKTOP.INF and change the last byte in the #E C4 12 line
for 13 (or 03 if the last byte was a 02, the 1 selects verifying file
deletion). (I've read in another document that this is supposed to be 01
for low rez, 02 for med rez, and 03 for hi rez, but the support desk
say set to 03)

You can also send them a blank disk and they return it with MEDRES.PRG
which is put in the AUTO folder and also fixes the problem.

Their address: Atari Helpdesk,
P.O. BOX 200,
Dartford.

> for long names though. Dunno what you'd do with them when you try to extract
> them, but at least it wouldn't choke...

I know it:
You can create unique filenames during extraction (example: longname-1 is changed to longname.-1, longname-2 into longname.-2 instead of both being mapped into longname), even if the original names on the unix-machine aren't unique up to the first 8 chars + 3 chars extension.
For example if i have extracted sources from usenet with unshar on the unix machine, i normally don't want to rename dozens of files. Instead i am archiving the whole directory as it is with zoo. At home when i am extracting those files, zoo tries to create unique TOS-filenames or asks me wether i want to rename it.
What i also like is that with zoo i can use arbitrary long names on the parameter line to specify the archive file. Arc simply cuts after the 8th character. Zoo would try to open the file even if the name does not constitute a valid file name on TOS. Now you could ask: why do you want this? - Since i am using '/' instead of '\' as directory delimiter in my shell. Zoo can unpack '../archive', but arc will only try '../archi' (which fails) and i have to enter '..\\archive'.
Why does Arc make so much assumptions about the environment in which it will be run ? This must be code which is commented out in a unix version. Why not just use the same source anywhere ? Why those artificial restrictions ?

If somebody is interested: i have done a port of this file-program some time ago when it was posted to comp.sources.unix. I have also collected some magic numbers used by st-programs. The program can be used to identify files as executables, objects, sources for some language and even to provide informations about them like name of the font in a GDOS font file or size of the various sections (TEXT, DATA, BSS) in executables.
If i get enough requests, i could post the binary and/or source to the comp.{binaries,sources}.atari.st group (of course with all the collected st-specific entries for /etc/magic).

> Spectre GCR?

Sorry, I misspoke... You need to do some hacking to your ST motherboard
as well, to use overscan. If you'd rather not do that, you're better off
just tweaking the monitor. (It looks like a simple enough mod, though;
cut one trace, add a couple wires and a [debounced!] toggle switch.)

The software is available on terminator.cc.umich.edu. I don't have PageStream,
dunno what it knows. I know that Uniterm doesn't like it very much. I wrote
to Simon Poole, asking if he'd put out a new release that supports non-standard
screen sizes. Got no reply, so I've disassembled it and fixed it myself.
It's pretty cool now, 60 lines by 137 columns of text.

How do you start up Spectre GCR? The Overscan program runs from the AUTO
folder and tweaks some Line-A and other system variables. If you can boot
TOS before you start up Spectre, you might have a chance. Otherwise I doubt
it, but don't really know. If you wanted to make sure, you might be very
enterprising and burn your own TOS ROMs with the Overscan mods applied...

In article <32896@iuvax.cs.indiana.edu> pwp@iuvax.cs.indiana.edu (Paul Purdom) writes:
>Could someone say briefly what techniques the overscan software uses to do
>overscanning?

The hardware change is to cut the normal display enable signal (between GLUE and Shifter) and replace it with the composite sync signal. This allows you to actually display bits during the longer display enable cycle. The overscan software changes the physbase and logbase, among other things, to accomodate the larger display area. Unfortunately it's a little memory hungry with an SM124. Since the signal the ST is spitting out is now at a slightly greater bandwidth than the SM124 can accomodate, the effect is that the "top left corner" of screen memory cannot be displayed properly. The fix the overscan software uses is to add an offset between physbase and logbase. This pushes the region of memory that the ST actually draws on into a space that the SM124 can actually display.

This causes problems for a lot of programs that do page flipping for screen drawing, animation, etc. They're typically set up to grab the value of physbase, malloc a 32K chunk for their alternate buffer, and toggle things in, swapping their original physbase and their new buffer in for logbase as they please. This makes for a lot of screen garbage when using overscan. [The original assumption, which is true on an unmodifed ST, is that physbase == logbase. WIth overscan, logbase >= physbase in order to position the screen appropriately. Thus, you can't swap them around at will, you have to remember the original values, etc.]

I'm pretty sure the same sort of thing happens in color, but I haven't played with it as much. Fixing Uniterm required searching for every hardwired constant "24", "80", "132", "32000", etc., replacing them with appropriately calculated variables, rewriting the code that manipulates the screen memory, and finding weird little bugs caused by adding signed short integers to long addresses. [That last is No Fun.]

I suspect that more programs will be incompatible than not. Another pitfall is programs that use the Line-A screen width variable analogously with the horizontal resolution variable. [On a plain ST, the screen width is 80 bytes, in monochrome you get 640 pixels. No problem, 8 pixels per byte. With overscan, you need 100 bytes per line, but you won't see 800 pixels on an SM124. You could with a multisync monitor, but not otherwise. So, you need to be careful, and some programs don't seem to take things into account very well.] This all seems quite tedious, since programs are supposed to let GEM worry about the nitty-gritty details of exact screen size. Some do, and they work fine. Unix Windows is a slick example of one that does. Others run into problems...

Gee, this turned out a lot longer than I'd planned. Anyway, I'm rambling now,
so I'll shut up.

>>actually, darek mihocka and myself have ... disassembled ...

>This is what serious developers do ... to
>check EXACTLY what TOS would do in a given situation (and any commented
>source, no matter how 'ugly', beats a disassembly).

The fallacy here is that you think we want you to know EXACTLY what TOS would do. Publishing the source would make it impossible to change it, because people would start relying on accidental side-effects of operations. When that happens, we can't change the code without breaking those programs or maintaining those previously-accidental side effects. This is a maintenance nightmare.

Take this example: if you had source for the original Fsfirst call, you'd have seen that the only error it can return is EFILNF, file not found. You might have used that knowledge in your code somehow. In TOS 1.4 and beyond, Fsfirst can return EPTHNF, *path* not found. I consider this an improvement. If your code was expecting either success or EFILNF, and gets neither, how will it behave?

In an extreme case, you might have seen that there was a bug in Cconout when stdout is redirected to a file; the HIGH byte of the argument is written to the file, not the low byte, or something like that. This is a bug, not a feature, but if you take advantage of it we can't ever fix it without breaking your program.

Finally, take Malloc: you would know that Malloc uses OS POOL to keep track of memory, and that two successive Malloc calls are likely to result in two contiguous blocks of memory. People have in fact taken advantage of this, and the result is that we can't ever fix this brain-damaged approach to memory management. We're straitjacketed by the tricks people pull; imagine how much worse it would be if the whole OS were open to that kind of scrutiny!

You needn't tell me that UNIX source is available (if you pay for it). UNIX is different, because (A) it was designed better, so people don't have to resort to these tricks just to do ordinary things, and (B) people on UNIX systems don't come from a tradition of 8-bit game-machine programming, where the first question they ask is, "Where can I POKE to change rez?"

> of a window (or two, or three) that is not covered by the dialog box and
> therefore does not appear on the redraw rectangle list. When the uncovered
> part of the window(s) is redrawn the window data looks wrong because the
> part of the window that was not covered is old.
>

Here's my $0.02

Inside the same function do the following:

Immediately after the dialogue box is closed, do a
evnt_multi of Timer Zero and Messages wait. You should receive
a redraw message with a rectangle that covered the windows, and
then do the normal window redraw.

After you have done all these, do your internal data update.
Then do a window redraw with a big rectangle (full desktop size)
to each of the windows.

The code should look like:

```
foo( )
{
......;
......;
form_do( ... );
form_dial( 3, ... );

event = evnt_multi( MU_TIMER|MU_MESAG, ..., msgbuff, .... );

if ( event & MU_MESAG )
{ /* do your own window redraw */
do_redraw( msgbuff[3], &msgbuff[4] );
/* window handle, rectangle */
}
```

```
update_windowdate( ); /* update your windows' data */

handle = firstwin( ); /* get your first window's handle */

loop
{
/* rectangle = desktop rectangle area */
do_redraw( handle, rectangle );
handle = nextwin; /* get your next window's handle */

}while( handle >= 0 );

}
```

Hope this helps and works!

377. PC emulator outlook

Newsgroup: comp.sys.atari.st
Date: 1990-01-12 20:34:42 UTC
From: FNDDR@ALASKA.BITNET
Message-ID: <9001130810.AA27909@ucbvax.Berkeley.EDU>
Source record: 244871

Here's some recent info and a question.

First, Avant-Garde's answering machine claims that they are now shipping. I still haven't seen one. I hope the first person to get one will report on the net.

We had some money allocated to buy PC-Ditto II for an office 1040 ST. We waited until the end of December, when the money was due to expire, and were faced with either letting the funds expire or purchase another emulator. It looked to me like the only other game in town was PC-Speed from Michtron, so I ordered one from E. Arthur Brown. He says he doesn't recommend them for 1040s because it is hard to fit them in the required space, but I ordered it anyway for lack of anything else to do.

So, the question for PC-Speed owners: is it worth the trouble of fitting it in? If it is a well-behaved emulator (as PC DITTO I is for the most part) I will make the effort to cram it in whatever space is available. Otherwise, I'll see about exchanging it for Supercharger, which EAB says is an external DMA port plug-in emulator due out in 60-90 days.

Any information would be appreciated. Thanks,
Don Rice
FNDDR@ALASKA.bitnet

ps: in response to an earlier question of "why bother with pc emulators," one reason is to save space. If you simply don't have enough room to set up another computer, an emulator is a very nice solution...

378. Subtitling system

Newsgroup: comp.sys.atari.st
Date: 1990-01-12 21:24:11 UTC
From: kroe@sbcs.sunysb.edu
Message-ID: <4445@sbcs.sunysb.edu>
Source record: 244872
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

My sister is interested in purchasing an inexpensive system (< $2000) for adding subtitles to video. I really don't know much about her work, but the system should have fairly good quality, and it should be expandable so she can go into other areas of video. We have ruled out a Mac II based system as simply being too expensive. I have heard that many people are using Amigas for this kind of work, but I'd like to hear about Atari-based systems, too. If you have some experience in this area, I would appreciate comments about hardware and software. If you are actually using such a system, I would really like to hear what you have to say.

To avoid the usual Amiga vs. Atari flame wars, please send all responses directly to me.

I do have one question that perhaps anybody can answer: what exactly are the systems available for Amiga and Atari ST? I have heard about Amiga 500, 2000, 2500, and Atari 1024ST, MegaST, Stacy, TT, etc. Can somebody from each camp just list what systems are available right now and their basic capabilities? Again, please send to me directly, and if I get a summary which is particularly comprehensive, I'll post it.

Thank you.

Hello netters,
in article 5970 Mr. X wrote:
> For little more than 400$, you can get a complete XT with monitor.
> So why spend money on these emulators, anyway?
a) You have no good monitor
b) You have only a 360KB Drive, really boring
c) Mostly you have only 512K RAM, in the best way 640K, the emulators offer minimal 704K
d) You have difficulties to transfer data from one to the other machine
e) You have no mouse on this XT
If you have a good AtariST, lets say with HD and up to 3MB a good solution can be the new Emulator named Delta Module here in germany with 1MB RAM, which can be used under TOS as well and 16MHZ 80386SX for ca 1000$. For 200$ more you can plug in a 80387SX, of course clever kinds can use it as co-processor under TOS two and this processor has 16bit out and 32bit in as well as Atari. XT's are no good with no HD and good screen etc. but the PC-Speed with NECV20 is okay on a atari. It runs comparable to a XT with 10MHZ and makes CGA and Hercules. A Atari co-processor can be used like a 8087. In the Supercharger you can plug in a 8087, but it makes only cga, no good for your eyes. In the Delta Module you can have 32KB Cache for 50$. PC-Speed uses the Atari-Ram with 704KB direct under DOS and the rest, up to ca 3MB in a Mega ST4 as Ram-disk. In Supercharger 512KB are standard, but 1MB can be plugged in. When you built PC-Speed in your machine garantie goes lost, Supercharger uses the DMA-Port, but this can be weak at some computers. If you only use fast DOS-Programs frequently you can use the software PC-Ditto, it's price should go down when PC-Ditto II is on market.
Okay enough of that. Greetings

Source record: 244879

We now have about 5 useful official TOS patches that I can think of to run from the AUTO folder. Perhaps it would be reasonable for Atari to combine all of them into 1 program which reads a configuration file to tell it how big to make OSPool and how much buffer to set aside. Not at all coinciden-tally, this gets to look a lot like the MS-DOS startup mechanism. I'd be willing to buy such an animal, as long as it was both official and supported (that means that Atari would take names, and send a card to let us know when a new one was available).

Message-ID: <5321@blake.acs.washington.edu>
Source record: 244880

Larry's right... possibly Atari's best
effort should be put into the education system..

Seems like much of Apple's initial success has
to be attributed to their establishing of themselves
in the student market.

About two years after i graduated from Dartmouth, i
learned that the new Dartmouth students (freshmen) were
being handed Macintoshes at registration. THey'd pick
up their class schedule and a Mac Plus. THe cost
was built into the tuition.. though one was not
officially obligated to purchase a Mac.. 97% of the
entering students in fact did go home with one...
(perhaps a current Dartmouth student can confirm this).

A logical outgrowth of this is a preponderance of
users who stay loyal to Apple. Were I a few
years younger, I'd probably be reading comp.sys.mac
instead of comp.sys.atari. I don't think
it is impossible for Atari to enter this market
and follow suit.. in fact, i think the time is
ripe for Atari to do so.

Allan, When I got the 68881 board for my Mega, I did not get a library
or source code. However, as I use Prospero's software I bought their
drivers.

You mention that the Alcyon C compiler uses the 68881 if it is there,
otherwise the software emulation. How does it manage this. With
Prospero's compilers, ( I use Fortran & Pascal ), the result will be a
bus error on machines with no 68881. Does TOS1.4 have some trap that I
can call from Fortan or Pascal which will indicate the presence of a
68881 ??

Thanks in advance

Chris....

And of course it should work under Unix, BSD+SysV, Amiga, ST, PC and mac.
This is unfortunately an utopia. But things is getting better, Zoo works
on all these systems, arc does, and lharc at least works on BSD, ST and PC.
Then you can build e menysystem around them to get your program. If this
supersmart program had been done, there would be enough ccordination not
to have umpteen compression formats.

>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Yes, but it would seem that if there was a bug in the OS, the program would crash anyway (or at least misbehave) if the code was written correctly, so it would work with future versions of TOS.

There already IS a "maintenance nightmare" out there. Programs crash on new releases of the ROM because the programmers decided to ignore some rules. Or perhaps workaround some old bugs. That's gonna happen no matter what.

(correct me if I'm wrong; I'm guessing at this mostly)

>Atari could support it, that Atari would be crowing about that fact?
> ||| Ken Badertscher (ames!atari!kbad)

And 68010 compatibility of TOS 1.6? I know, it is not such an improvement
as a '30, but one might get a faster ST, and it may work.
Any comments from Atari on this?

An while I'm at the subject: could Atari release details about the
programming of the STE? I would love to get one if I could use its
extended possibilities. Sorry, I can't afford to become I registered
developer for this. I am just hacking on the Atari as a hobby, and
the required $100 or $200 is just too big a dent in my budget for that.

In my opinion there are a *lot* of ST users who would like to get the
real info on the ST instead of the unreliable books that are sold
today. Thus, I strongly disagree with Ken (was it Ken?) who thinks that
there would be no market for this. After all, since there has been
little advertising of the ST, ST owners tend to be people who know the
field, and know that a bad ST is better than a good mess-dos machine.
(This is not a flame to Ken, just a difference of opinion.)

>"The ST Enthusiats" (sp??).

I have version 1.67 of ZMDM, dated Sept. 1989. The ST Enthusiasts are
at Case WRU and I got my copy from Bammi there -- he just sent me
a change of address notice which is sitting on my work machine, but I
can look it up later. It's a super program -- whether it solves the
bugs that Covert goes on to list I don't know. There were some bugs in
1.65 and 1.66 that Bammi fixed very promptly.

I think that he is out of town for a while. Let's see if he answers
this posting, as the authors should be the ones to distribute software,
and my version has some special patches in it.

408. Thunder! has a problem when "not installed"

Newsgroup: comp.sys.atari.st
Date: 1990-01-14 03:54:20 UTC
From: nelson@kodak.UUCP
Message-ID: <2269@kodak.UUCP>
Source record: 244752

I have been experiencing a problem with my hard drive in that my ST would seemingly hang when opening a GEM window. (I once posted a note asking for help here.)

This problem persisted using different cpu's (a 520 and 1040), and different TOS's (1.0 and 1.4). It persisted with different mmu's. It persisted with different disk driver software (I tried Atari's and Supra's). The only thing I hadn't changed was the disk drive, so I upgraded to a bigger drive, and sure enough, I still had the problem.

I finally found the problem!

The Thunder! spelling checker accessory (by the now defunct Batteries Included) has an option to select whether or not to load the main part of the accessory. If the program is configured to always load Thunder!, there's no problem. But, if it is configured to bring up the dialog box to ask whether or not to load it, and "no" is selected, then a piece of Thunder! is left hooked into the system which causes the problem. It appears that 8 programs will run before the system hangs.

In order to have the option of loading Thunder!, I wrote a small auto folder program to rename Thunder! as required. I will email it to anyone who requests it.

Although I know the first rule of debugging these problems is to remove all auto folder programs and accs, and I tried these methods, I never seemed to make the connection of Thunder! in the non-loaded mode with the problem I was experiencing.

BTW, Thunder! works ok on TOS 1.4 except for the problem noted.

I hope my experience helps someone else out there.

410. Atari Lynx deserves to do well

Newsgroup: comp.sys.atari.st
Date: 1990-01-14 15:03:11 UTC
From: mgardi@watserv1.waterloo.edu
Message-ID: <604@watserv1.waterloo.edu>
Source record: 244754
Cross-posted to: comp.sys.atari.st,rec.games.video

I just picked up a Lynx from Buffalo -- just walked into a computer store and bought one -- they had four in stock.

It would have been better if Atari had been able to get wide distribution set up before Christmas (I'm sure no one would agree more than Atari) but I don't think it will hurt the Lynx in the long run.

There is NO comparison between the Gameboy and the Lynx. The Gameboy is a great extension of the single-game handhelds that have been around for quite awhile -- The lynx is a full video game system that can be judged face-to-face with any of the full blown systems. The graphics and sound are some of the best I have ever seen.

Whether or not the Lynx DOES well, it certainly DESERVES to do well. The Lynx is an extremely nice product, and atari has a responsibility both to it and to us to do as much as it can to establish it as THE premier handheld game system.

This is not to put the Gameboy down -- at $90 U.S. it is also a very good buy and I enjoy both Super MarioLand and Castlevania a lot -- but let's face it, it is not even in the same class as the Lynx.

There is talk of a portable sega-genesis on the drawing board, and I'm sure others will follow -- but for now Atari has the field to itself. I hope that it makes the most of it.

David Rowley

This is NOT always the case. Often software is published in STart
that is public domain or Shareware. STart always states if a program
falls into one of those categories. Aegis Animator does.

>
>If you give away stuff that is as cheap as this, the only stuff we'll be
>able to get for the ST will be pretty damned expensive!
>

Cheap?? Have you ever looked at the European ST magazines? They are
far superior to STart, and a LOT cheaper. I paid $8 for ST Format,
WITH disk and found it much more interesting and useful than the
$15 I paid for the Feb. issue of STart.. In fact, at one store I
visited in Cleveland, the owner was selling so many European magazines
over American mags that he stopped carrying all but Current Notes
(which is also good, IMHO).

Heck, for the price of two STarts w/disk, I could go out and BUY a
real program, not a collection of programs of which 1 might be useful
occassionally..

>computer itself the power supply, monitor, and disk drives are fine. Also when
>it flicks on the drive light and the monitor also flick for a fraction of a
>second.
I already wrote a small message on this type of power supply problem. Its simply a cold solder joint or your capacitor at c11,10,c13 is leaky not working correctly. I suggest you get someone to look at the power supply for any cold solder joints. The capacitor at c13 can be replaced cheaply on the 520st and 1040 st models.

I run a 24hr BBS and havnt had any problems with my tos 1.4 as others are complaining about i noticed the 400 file limit per partition, but if you put 400+ files in a folder on a partition it seems limitless so far. I think its more constructive to look at the good points of Tos 1.4 and not dwell on the really quirky exceptions everyone is finding because they run this or that accessory. We will here endless errors from users who dont realize that accessories screw up program operations..and then the user blames it on Tos 1.4???? This is simple note to other atari users. I run 250megs on all partitions 24hrs have millions of accessories and Pd, shareware and original files!, and I love Tos 1.4. Thanks Atari for the good work. I realize some errors crop up but lets not forget the good fixes. I love the speed for hard drive IO, the folder name changes, window display speed. If anyone has reason to complain its because 250 Megs is completely filled.

All these TOS bugs are really confusing me... Could someone please
clarify. Here are my questions.

1] With respect to TOS 1.4, what IS the 40 folder limit?
2] If I have more than 40 folders per subdirectory, does it crash?
3] If I have more than 40 folders per PARTITION, does it crash?
4] Does the original FOLDERXX.PRG still work for 1.4, or do I need
a newer version?

5] This is to apratt of Atari
I already have TOS14fix.prg in my autofolder. Now I am supposed to
put POOLFIX into it too? Why not incorporate both into ONE file so
we don't end up getting 18 stupid patch programs cluttering up our
AUTO folders?

Source record: 244762

(This has to do with the thread about about documented source for TOS etc. where Allan Pratt makes an argument involving developers taking advantage of "features" (my word, definitely not his). Sorry for not quoting)

What I don't understand is why don't the excellent development team at Atari just go ahead and make the changes and break all the programs that don't follow the rules. I'm not a developer, but I doubt that there was any documentation that said 2 successive mallocs would yield neighboring blocks. (same for other examples)

It seems to me (IMHO) that if developers keep taking advantage of "side-effects" and Atari tries it's best to keep programs from breaking, eventually, you won't be able to revise TOS at all.

I mean, if a program breaks because a programmer takes advantage of an undocumented or illegal "feature" which isn't there at the next os revision, isn't that the programmer's fault?

Also, about working around bugs in TOS, there is a legal way of checking TOS version, right? So, can't you write your program so it uses a "workaround" for TOS 1.0 but does things the right way for TOS 1.4 (sort of like how Ian Lepore's GEMFAST bindings simulates the TOS 1.4 file_selector if your TOS is <1.4) or whatever the case may be?

(I think they're right. Maybe Atarians ARE militant :-))

Somebody on the BBS I run posted a message saying that it has shipped,
and he has his. The first (few) batches will go to those who have
already sent in their coupons to get PCD II for $150. Then I guess it
will be available to everybody else.

From: sbrown@bgsuvax.UUCP
Message-ID: <5324@bgsuvax.UUCP>
Source record: 244771

Well I figured out one of my problems with sound but the next problem
is purely due to lack of being able to find documentation on it. My question
is what are values that must be placed in Sound registers 0-5 to achieve notes?
I am not musically inclined and I cannot tell by just listening. To clarify my
question, what values must I use to "hit" certain notes? Telling me what
values I need to hit certain wavelengths would also be acceptable. Also, feel
free to include any extra info about sound since I am still learning it.
BTW: I would prefer the answer to be mailed to me. Thanks...

From: schock@cpsc.ucalgary.ca
Message-ID: <2339@cs-spool.calgary.UUCP>
Source record: 244772

Hi all,

I'm currently looking for a working version of YACC or Bison
for the ST. I've got the source code for Bison, but it looks like there
is going to be some interesting changes which have to be made. Has
anyone already made these changes? And if so, where is the executable
(and source if possible) available?

Thanks in advance

Craig Schock
University of Calgary.

429. Laser C vs. Prospero vs. ???

Hey, I need to buy a decent compiler for the ST... How does Laser C rate vs. Prospero C? I know megamax has been around longer and so I tend to trust their compiler a tad more, but then I saw an add stating that Prospero was ANSI... is Laser? How about bugs in both compilers? Anything major? (Mark Williams is full of bugs).

If anyone has ANY experience with either Laser or Prospero, please e-mail me some info.. thanks in advance!

Does this include a trap handler for the 68881 that catches those '020/'030
floating-point ops and executes them on an 68000?? If so, could you explain
a little more? Or is there anyone out there who has this (or any other such)
software on-line or in electronically readable format and could email me a
copy ??? Thanks VERY much!!

>Prospero's compilers, (I use Fortran & Pascal), the result will be a
>bus error on machines with no 68881. Does TOS1.4 have some trap that I
>can call from Fortan or Pascal which will indicate the presence of a
>68881 ??

No, there is no such trap. The correct way to test for a 68881 is to redirect the error handler, then try to reset the 68881. If your program continues normally, there is a 68881 present. If the error handler is called, there is none. Then all you have to do is to reset the error handler.

The Alcyon compiler does not do any 68881 checking. There simply is a library provided that replaces the original software floating-point library.

If you need software that checks for an 68881 and runs unchanged on systems with AND without FPU, check out Turbo C/ST by Borland. It has that feature built in, without the need to buy additional libraries (such as the Prospero lib, which costs about as much as the entire Turbo C !!!)

435. Turbo C/ST: Update

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 08:05:42 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <9001150805.AA15862@ucbvax.Berkeley.EDU>
Source record: 244779

Hello all,

I promised to keep everyone up to date on Turbo C for the ST, and here's some news on this topic.

I called Borland Germany in Munich last friday, and spoke to one of the ST programmers. He said if all goes the way it's planned, Turbo C/ST v2.0 and the source level debugger TD v1.0 will be released in March (1990 :-).

That date does *not* apply to the English documentation. They still haven't found a producer/publisher/whatever for that. Sorry, no good news there yet.

There are all sorts of new goodies, such as a complete PC-compatible BGI (= Borland Graphics Interface) implementation. And TD is a sight to see ...

Incidentally, the person I talked to said that Borland Germany got a number of complaints about the fact that TC/ST is not available in the US. He suggested that everyone who would buy TC if there was an official US version should write to Borland USA and demand an English TC version. It's entirely up to Borland USA to make such a version available, Borland Germany is more than willing.

Please remember that all of the above is not official in any way, it's just a summary of a telephone call (and it might have been a bad line :-).

436. Font editor for 24-pin printers needed

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 08:05:54 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <9001150805.AA15903@ucbvax.Berkeley.EDU>
Source record: 244780

Hello all,

I need to design a font for 24-pin matrix printer (the NEC P6, but I think
the fonts are the same on any generic Epson-compatible 24 pin printer).

I have a PD font editor, but am nowhere near satisfied with the program.
I would have sent in the shareware fee for the sources, but the program was
written in Basic which I hate.

Does anyone know of a good font editor for 24-pin printers in the public
domain, that takes into account such things as the "No-needle-may-fire-twice"
problem etc., or source to a font editor that could be adapted without too much
work?

All sources in a serious language, such as C, Pascal, or APL, will be con-
sidered. If I adapt and/or modify the program, the result will be placed in
the PD as well.

Thanks for any and all info.

PS: As a last resort, I'll take a PC program as well! :-)

From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500080@uxa.cso.uiuc.edu>
Source record: 244781

A company in Germany called IKS has come out with a US$90 product
that installs in your SM124. I read a review in the January
issue of 68000ST, and they seemed to think it was a solid product.
It produces grey scale to emulate the low and med resolutions
of the ST. If anyone is interested in the address, or if any
Germans out there have the product, I'd be interested to hear
from you. I will order one in late January and post my experience.

Prices listed were DM129 for the board and chips
DM149 for the board assembled
DM259 (I think) to send in your monitor and
have it installed...

439. How to read the joystick ?

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 12:20:37 UTC
From: rgg@munnari.oz.au
Message-ID: <3006@munnari.oz.au>
Source record: 244783

I have been using code similar to the following to read the joystick, but I want to know whether this is a 'legal' method. I know it works on TOS 1.0 and 1.4 (Yes you can get TOS 1.4 in Oz now 8-) but I haven't tested it on other versions of TOS and I would like to be able to sure it will work with future versions.

Here is the code:

```
-------
#include <osbind.h>

main()
{ int i;
int *loc;
long *ssp;

loc = 0xfffc02;

ssp = Super(0);
for (i = 0; i < 500; i++)
printf("%d %d\n ", Bconin(4), *loc);

printf("turning off mouse.\n");
Bconout(4, 0x12);

printf("turning joystick on.\n");
Bconout(4, 0x14);

for (i = 0; i < 500; i++)
printf("%d %d %x\n ", Bconin(4), *loc, *loc);

printf("Turning mouse on.\n");
Bconout(4, 0x08);
Super(ssp);
}
-------
```

By the way the Bconin doesn't seem to provide anything useful, just a constant value.
Thanks in advance for any help,

Rupert G. Goldie

440. Help Needed with Atari H/W interfacing.

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 12:27:27 UTC
From: shc1@ukc.ac.uk
Message-ID: <2706@gos.ukc.ac.uk>
Source record: 244784
Cross-posted to: comp.sys.atari.st,ukc.micro

I am present in the process of undertaking a project, in which I need
to interface a standard 6821 PIA to an Atari ST.

However, as with every project, I have a problem.

My problem lies in the fact that the cartridge port has no R/W line,
and that the GLUE chip does not allow you to write to ROM space anyway.
(Hence I cannot use the Rom3/Rom4 lines as dummy R/W lines)

At the same time I see products on the market (such as Robot Arm Controllers)
which use the cartridge port, and obviously find some way of getting around
the above WRITE problem.

If Anybody (but anybody) has had past, present or planned future experience
with interfacing to the Atari, Please could you drop me some helpful hints.

Yours (a little bit more that truly) Sam.

p.s. Is the DMA port a viable alternative ???

>>The following would not run from my auto folder (activated after the
>>tests on the software listed above):
>>
>>Pinhead
>>UIS II
>>Headstart
>
Apologies if I'm the 1000th person to point this out (we're a bit peripheral with our news feed), but I thought that TOS 1.4+ did away with the need for both Pinhead and Headstart.

Pinhead bypasses the bit-clearing routines used by TOS 1.2- when loading programs, and from the reviews I've seen TOS 1.4 doesn't do bit-clearing (or at least gives you the option). Headstart auto-loads a GEM program, which TOS 1.4 also allows you to do.

I guess that Headstart does have the additional feature of letting you choose from a list of programs to auto-run, so there is probably some point in adapting it to the new TOS versions. I doubt that this has escaped the notice of Charles Johnson, and I'm confident that if it can be done it will be, in the not too distant future.

(As you might have guessed, I'm a CodeHead/Little Green Footballs fan)

By the way, as of last week, Atari UK were still saying they don't have any TOS 1.4 ROMs to distribute, though some are apparently on order. I guess it makes sense for them not to bother. They see the ST range as basically just for games, and market it accordingly. Games players probably don't need TOS 1.4 (in fact, there's been a lot of fuss over here about how the STE & TOS 1.6 are breaking lots of games). The only trouble with this strategy is that the Amiga is - let's be honest - a better games machine and is accordingly now outselling the ST in the UK. The ST's advantages in programming, word processing, DTP, hardly show, given that most places that sell the ST here stock very few non-games applications & utilities.

From: krieg@jupiter.uucp
Message-ID: <1871@mrsvr.UUCP>
Source record: 244787

I have had this weird quirk in my ST system ever since I got it (3 years ago) and I am wondering if it is normal. I have a 520 ST, a single sided disk and a double sided disk. The double sided disk is drive A and the single sided disk is drive B. Whenever I access drive A, drive B spins also. Should this be? Is this harmful? The drive light on B does not come on, but if I have a disk in there, I can hear it spinning. If I access drive B, drive A does not spin. Anyone know what is going on?

If UNARC is the shareware program by Gerry Szekely then I can
tell him about your problem. Gerry is a good friend of mine,
and I sent him a check for his Shareware programs UNARC, ARCIT,
and ARCITSHELL. All three are very good programs. Gerry told me
last week that he is modifying ARCITSHELL to handle the new features
in ARC 6.02 now. So, let me know which UNARC program you are talking
about. If it is Gerry's it should say so when you use it.

Regarding Word Writer ST (Timeworks, Version 2.0),
I need help with a minor problem:

Having loaded an ASCII text file into WWST,
how do I get "format" to work? When I tried
this past weekend, the text would _not_ reformat.

Anybody know the answer to this one? HELP!

Thanks in advance.
Regards, Bill

From: woife@samos.Sun.COM
Message-ID: <1986@texsun.Central.Sun.COM>
Source record: 244793

Four month ago I bought the assembled board from IKS.

The kit was preinstalled and all I had to do was to buildt in
the bw/color switch and connect about 15 cables inside the monitor.
This is not as easy than it seems:
You have to work very carefully, and check things twice before
connecting them. If you are experienced it'll took about 3 hours
to do all the stuff.
If it works : fine; if not : happy searching.

The bw quality is nearly the same as before the upgrade
but it very hard to work with 50 Hz color.
IKS recommends to execute a 50to60hz.prg as first file of your
AUTO folder.

If you have still questions, feel free to contact me.

Bill, could you PLEASE have one of the ST Enthusiasts post the source code
to the latest version of Zmodem?? I have a lot of friends who would like a
version of Zmodem which uploads at full speed. And I would like to add other
file extenders to the list that are recognized as binary files.

The only problem with an 'anti-body' program is that some jerk will
no doubt create a virus that 'looks' like an antibody program,
flashing the screen, etc, so you think you're safe, when in fact
you're being infected. The best defense would be source code to
an anti-body program so that you could customize the bootup action.
If my disk boots and says "Steve Goldstein, this disk is safe"
I can be pretty sure it's MY message, and not a deviant strain of a
'public' anti-body program with a much more generic message.
```

Jwahar, I know what you mean about the email address. I can't find your node on our list either. So I can't send email to you. Rats!!

I would love to get a copy of your latest version of Zmodem so that I can try to find out why it is soo slow to upload compared to ST TERM. It may be a problem with FOREM ST more then your protocol. And I would like to add several file extenders to your list of file extenders which are recognized as binary files. I might want to even make it self-configuarable so that the user can change the list.

But the main thing is the slowness of the file uploads to Forem ST boards. It is strange because Zmodem xfers at full speed for downloads FROM Forem ST boards. I really like Zmodem, I use it almost exclusively!!

P.S. I can't find "dsrgsun" on any of my UUCP mailpaths. But I do have a GEnie account. It is R.COVERT1 so you can contact me there. Thanks for your response and your great work on this fine program.

More text deleted so the #@&$*#$!@! "mailer" will accept this...

> -=- PrayerMail: Send 100Mbits to holyghost@father.son[127.0.0.1] >
and You Too can have a Personal Electronic Relationship with God!

This post brings up some questions that I've been wondering about for a while.

1) Is the "overscan mod" the one I have the hardware docs for
(it was reposted in Nov or Dec '89) that also needs a small
transistor installed, along with a debounced switch, some wire
and some trace cutting? If not, how many such mods are
there and how do they rank? I know that overscan can be
done in software (I've seen the Care Bears demo - impressive),
does that only work well if the program running knows about it?

2) Would things be simpler and/or even higher resolution with
a multisync monitor? (I guess I'm asking what the hardware
limits are, for the ST and for the monitors to track the video).

3) Could a "transparent" interface be written, (see posting by
David Beckenmeyer on multiple 80x25 windows on Moniterm while
running vsh) that could automate high res to overscan
switching? I envision a program that can't take overscan
being automatically run in a "Std" resolution window,
centered on the screen, and good programs being able to
immediately take over the whole screen when they run.

4) There are several adaptors and lots of multisync monitors
about, how well do they work? How weird is color on a greyscale
monitor? How is High res (or overscan) on various color
monitors - for that matter, how is it on a greyscale
monitor? If dot pitch (on color monitors) is the only criteria

for "mono" res sharpness, what dot pitch is acceptable?
Email me your experiences or responses, and I will post a
summary to the net.

5) People with overscan and/or Moniterm or other large monitors,
send me (or post) lists of programs which work and of the ones
that break with the extra pixels. I'll post a summary of
that too, if there is enough response.

6) Atari folk: will the TT color monitor be significantly
incompatible with third party multisyncs? (I recall it took
quite a while before third party monitors showed up for the ST).
For that matter, will my old monitor(s) work with a TT?
(That would also answer the above question, I think).

Thanks in advance, sorry this got so big.

Bob Pegram (pegram@griffin.uvm.edu)

WARNING, I am not certain that above address is correct, since they've

> I'm writing a C program and have a small problem - I want to time how long
> a call to the Random ( ) XBIOS function. The problem is that I can't figure
> out how to time it in increments smaller than 2 seconds.

The Random() xbios function executes too fast to be timed even with a clock that ticks 200 times a second. You could call it 1000 times and then compute the average, but you'd also be timing the loop that called Random().

The 200-Hz system timer is in protected memory and accessible only in supervisor mode. The dLibs C library (the one that comes with the Sozobon compiler) has functions that make this easy. The program below demonstrates these functions (with an example that takes a few milliseconds to complete). If your compiler doesn't have start_timer() and time_since(), you can find the sources in the dLibs timer.c file.

To compile this with Sozobon, cc it with the -f flag (floating point).

Incidentally, I got these results:

0.075000 with no scrolling (starting with a clear screen).
0.175000 if the program had to scroll the display.
0.445000 when I redirected it to a file.

Message-ID: <33082@iuvax.cs.indiana.edu>
Source record: 244799

The question of whether or not to up grade a ROM operating system so that old programs work is delicate. Many users would like to beable to up grade to remove bugs in their operating system without losing the ability to run their old comerical programs. Their needs should be balanced aagainst the difficulty (or impossibility) of fixing the bugs while still being able to run old programs. The benefit of each change needs to be compared with the trouble it causes users of old programs. For the most part, people who write their own programs like improvement, but people who buy programs like stability. I do both myself, so I feel for the people that have to decide what to do in each particular case.

Hi There

Sorry for the post. Mail to you bounced.

I saw a copy of the GFA BASIC Compiler 2.0 at my local dealer here in Santa Clara (SF Bay Area). They operate a mail order business as well so they should be able to ship it to you no problem. I think it was priced at ~$53.00.

B+C Computervisions
3257 Kifer Road
Santa Clara, CA 95051
(408) 749-1003

I have no affiliation with B+C except that of being a very satisfied customer.

If $53 is a bit steep for you, you can always keep hoping that STart magazine will put in on the disc in an upcoming issue. They've already put out GFA BASIC 2.0, GFA Object, GFA Vector and GFA Companion.

Hope this helps.

Your pal,
Mike Goo

Having just posted a note saying how I feel for those of you that must maintains TOS, let me also say that I think it would be helpful to release the source for TOS (or as much as possible if Atari does not own it all). I don't think Atari has much to lose from copies of the ST (my guess is that if someone came out with a copy, ST sales would go up). Problems from bad code being written would be offset by occasional good suggestions for improvements (UNIX did not start out all that great). I think that Atari only needs to worry about the bad code that would end up in successful programs. Most of the bad code will have no effect and future operating system suggestions.

I remember learning a lot by reading disassembled code for the first Radio Shack computer.

459. Monochrome jitters

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 18:24:30 UTC
From: jimh@ultra.com
Message-ID: <1990Jan15.182430.2495@ultra.com>
Source record: 244703

I have an Atari monochrome display that's about 5 months old.
Recently, it's gotten the jitters and they're getting worse.
The symptom is a jittery screen display, but only the top half
of the display is affected. The symptoms appear only after the
unit warms up. The unit was rock-steady when new.
My guess is that it's a heat-related horizontal sync problem.
I have noticed this problem on at least one other monochrome monitor.
Anyone know the cause and cure? If I had schematics I'm sure I
could troubleshoot. Thanks in advance.

Oh, decisions decisions... I just found a place near where I live
which sells Wordperfect/ST for $99.... And now that I know there is
a new version which has all the bugs fixed and works faster, I am so
tempted to buy it.

One question though - does anyone know if the Atari Development
section of Word Perfect plans to release a version which is comparable
to the just-released WORD PERFECT 5.1 on the Ms-Dos computers?
I am very close to getting PC-Speed or a PC clone and am wondering
if I should get the WP4.1/ST version WP5.1/PC.

If I knew that such a version was at least IN THE WORKS at Atari
Development I would gobble up this ST version instantly, especially
since I am such an ST patriot.. Does anyone have any news from the
company?

>>
I Have a suggestion for Atari to consider. Remember how Pepsi supports
the Gameboy. How about Atari getting in contact with Coke marketing and
Show the world that a better product also supports a better tasting
beverage. Besides if it goes as well as the Pepsi gamboy thing Atari
could make a mint from Coke maybe even make a game called kick the can!

If anyone from Atari reads this, think about it you could sell Coke
thousands of Lynx's and get commercial advertising at the same time!

Just a suggestion as I think both companies would benefit. I even plan
to buy one and a Coke contest to get one would be worth a try too!

Not yet but an offshoot idea from that one is to make a small accessory that
when anything is written to the boot sector of the A or B disk drive the
screen flashes and the info or the Sector number can be display momentarily,
if this occurs and option to immunize the disk comes up and allows you to
clear away a virus. I have started to work on such a program already in a
different manor to protect my bbs from Back doors. If you want ill do this
simple program on the side as I work on the Back door Killer.

>Thanks in advance.
>Regards, Bill

The problem is there are hard returns everywhere, which tell WWST to stop formatting. Hard spaces don't help either.

The trick I used, which worked reasonably well, was to do a replace of a space for a space. This would replace the internal representation so you'll have SOME formatting capabilities. It won't fix everything, but I doubt that is possible anyway.

Hope this helps.

Mike

I've got overscan, but I found the hardware aspect of the project
confusing to say the least. What's the canonical setup for a rev D
1040 stfm ??

Well, I have the Electrohome ECM 1310U Series Multi-Sync monitor and its great, works in all three resolutions, Low, Medium and High. It has VGA qualities so when the TT comes out I dont see any problems hooking it up. It has underscan built in the back and if I tie down line 4 in the RGB Cable I have instant Monochrome mode. In monochrome mode it looks great. Multi-Sync monitors are the wave of the future as I and many programmers have and will be writting programs and differenct Hrz rates. Eg(85 or 45).

The picture definitely is better, this particular monitors resolution is 720 by 540 lines. It has antiglare .31 mm dotpitch with many other built in fancy features. I run all european programs without any problems. As for the price phone electrohome its only drawback is that it has no speaker but with the STE that isnt a problem. I hook mine up through the audio line to my ghettoblaster.

Dave Tomesch, Super BBS (519) 749-1206, Kwest Co-Chairman, StarTrak Inc.
"Never say Never"

Anyone wishing more info on the Special RGB cable hookup just send me Mail. I made one for the Kwest Usergroups Electrohomes Projection TV System used at the University of Waterloo , Math and Computer building.

468. Re: Need help w/WWST

Newsgroup: comp.sys.atari.st

From: bane@mimsy.umd.edu
Message-ID: <21837@mimsy.umd.edu>
Source record: 244712

The problem you're having is that when WWST imports an ASCII file, it leaves all the spaces as good old ASCII space characters. When you type text into WWST normally, it puts a different character between words that it calls a "variable space". The format command will only break lines at variable spaces.

The hack I use is to import the text, save it as a WWST formatted file, then pop out to a shell and do the following translate:
% tr '\040' '\036' < oldfile.doc > newfile.doc

The resulting newfile.doc will format properly.

Hmm, this reminds me of what happened when Atari brought out the XL operating system for the 8-bit computer.. A LOT of programs broke because programmers did not follow the rules...

> John

I have Mark Williams C, and am curious: What is the difference between malloc() and Malloc() ???? I am writing a slideshow/picture viewing program, and when I used malloc() to get a 32k block of memory for a picture, the picture always had some stray data at the top (looked suspiciously like the other variables I was using).. However, when I used Malloc() this disappeared. Boy, I almost pulled my hair out trying to figure out what was wrong!!!

470. 68881 Co-processors

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 21:40:14 UTC
From: alex@athertn.Atherton.COM
Message-ID: <16669@laurel.athertn.Atherton.COM>
Source record: 244714

One note about 68881 co-processors:
You should re-write your code to take specific advantage of the
device if it is, in fact, there. Otherwise, the speed inprovement that
you recieve is not very good. For example, a fractal tree drawing program
that I wrote does very intensive math calculations:
strictly in C, it takes about 20 minutes to draw a 'tree'
in C, but using the 68881 math libraries, takes 13 minutes
(better, but not really all that good)
re-coding the algorithm to directly access the 68881,
(ie, load all the registers and do the calculations there),
it takes under 2 minutes.

Another example is a fast fourier transform program:
to analyze 64 data points, in C: appx. 32 seconds
using the 68881 directly (via
C macros): .38 seconds (less than
4 tenths of a second).

How you use the 68881 is very important to the performance benefits
you get from it!

472. ZMDM 1.63 Failure Explained More

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 23:03:12 UTC
From: covertr@force.UUCP
Message-ID: <480eb0b0.14a1f@force.UUCP>
Source record: 244716

To Jwahar Bammi, Bill shroka, Bill Silvert
and most importantly to
THE ST ENTHUSIASTS AT CWRU:

The reason that I posted my original message about version 1.63
is that it came without the source code. All of my previous copies
of ZMODEM were distributed complete with source. Also, the people
who wrote it did not completely identify themselves. All they left
in ZMDM163 was the message "ST Enthusiasts @ces". thanks to Bill
Silvert I now know that the ST Entusiasts are at Case WRU.

If the ST Enthusiasts had released their source code to ZMDM163 I
would have tried to fix the problem of the aborted uploads myself. As it
is I have left a couple of message here on USENET. I would like to thank
Bill Shroka and Bill Silvert for their responses. I am sorry that I can't
reach Jwahar Bammi directly.

I still do not know why ZMDM163 was released. It was appartently released
without Jwahar Bammi's knowledge, and it definitely did not credit Jwahar
Bammi for his work on it. Perphaps Jwara has not worked on the ST version
of ZMODEM?? Maybe the ST ENTHUSIASTs are responsible for the ST version
of ZMDM?? I don't know.

I do know that I like ZMDM and that it uploads at 1600 cps with my
US Robotics HST modem to several Forem ST boards. But some of my friends
can not upload at the same throughput using it on their USR HST modems.
It is very strange that it works at full-speed to only some boards.

For Jwahar's information this is how ZMDM 163 fails:
Using Zmodem to upload a SINGLE file (i.e. non-batch mode but uploading a binary
file):

FOREM BBS: Waiting for first 1024 byte block

SENDER: sends all data from file

FOREM BBS: ACKS first 1024 byte block

SENDER: starts sending the entire file a SECOND time

and it continues like this until the SENDER gets tired and hangs up.
So, ZMDM163 definitely fails, and is reproducible. ZMDM163 does not
fail on EVERY FOREM ST board, but on the boards that it does fail,
it fails everytime.

Earlier version of ZMDM did not fail in this manner, they just didn't upload
very quickly. The docs that came with ZMDM163 describe that ZMDM163 fixes the
slow upload problem but they don't mention the fialure mode.

So, the failure to upload to SOME FOREM ST board is the problem that I am reporting. I know of severla other people who are experiencing this problem so it is reproducible.

ZMDM163 does download at full speed w/o errors, but earlier ZMDMs did also.

Thanks again to the people involved in this.

473. amcgdos.arc on terminator.cc.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1990-01-15 23:20:46 UTC
From: squibby@eleazar.dartmouth.edu
Message-ID: <18526@dartvax.Dartmouth.EDU>
Source record: 244717

Folks,
I pulled something off of terminator called amcgdos.arc.
Inside of the Arc file was a .prg file and that's it.\
No docs, no names of folks begging for $. When I try to run
the 6K executable it gives a short copyright message
which was to quick to read, then stated that AMC-GDOS not
installed as ASSIGN.SYS was not found.

My questions are:
-Is this a PD/Shareware GDOS?
-Is anyone using this?
-Is there any documentation?
(assige from the gdos primer on terminator)

Thanks in advance,
Clark

474. Spectre GCR -- Help!!

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 01:07:22 UTC
From: ged@image.waterloo.edu
Message-ID: <12970@watcgl.waterloo.edu>
Source record: 244718

I'm having problems getting my Spectre GCR to read GCR formatted disks.
The system that I am using is as follows;

1040ST (purchased 1986)
2.5 meg memory expansion
SM124 monochrome monitor
20 meg Supra hard drive

THE SYMPTOMS:
(i) Spectre formatted disks work fine.
(ii) Disk speed is correct. (300 rpm)
(iii) If I add some shielding (aluminum foil) around the internal
drive the public domain disk supplied with the Spectre GCR
verifies correctly. ("v" from the "hi dan" menu) However,
if I run 'R' (read all sectors) the read fails on two or three
sectors near the end of the"read" program. I thought "R" and
"v" performed basically the same function. Anyway, I assumed
that I still had a noise problem so tried more shielding
and moved the monitor and hard drive about three feet away from
the internal drive. This had no effect.
(iv) Disks formatted with a real MacIntosh do not verify and do
much worse than the public domain disk when the "read" program
is used.
(v) Disks formatted with the GCR verify and read without problems.
(vi) I thought maybe the problem was disk allignment so swapped
my disk with that of a friends dead ST (dead power supply).
The results were identical. Is it likely that both disks
are out of allignment.

I'm at a total loss as to what to do next. This is the second GCR cartridge
that I have tried. I sent the first one back after having similar problems
with it. I had assumed that it must have been a faulty cartridge -- that now
appears unlikely.

Any help would be greatly appreciated.
Please send responses to:

gfield@sirius.uvic.ca

475. Hard Drive for sale: $550 for 2-25meg systems

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 01:11:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9001160137.AA21539@jade.berkeley.edu>
Source record: 244719

Hard drive for sale! 50 megs total storage for $550! Just plug in and go!

Note: Atari ST Computer and eletrical outlet required!

This is a hard drive system i put together myself. Takeing a bit here and there to put together what i want to get rid of now since I only seem to use 3 megs of drive 1, and use drive 2 for makeing 1 minute backups of drive 1. How wasteful can you get?

------------------Caution! Sales pitch starting!---------------

It is made up of the following:

2- Miniscribe 4020 drives: These are rated at 17 meg at MFM or 25 megs RLL (I've formatted them at RLL, 480 tracks standard for this drive.) Both drives have no bad sectors that i could detect. Both went thru an ICD format program for a couple of hours with a check twice. This was done again to make sure, then left alone and i havent had any problems show up. (This is since OCT/Nov 89) They are both 5 1/4 inch.

1- ICD adapter: I originaly had a old ICD adapter, the kind that would not let the computer boot unless drive was turned on. It was sent back an an entirely new one was put in that doesn't have that problem. This was purchased around NOV 89.

1- Omti 4027a : I had one in Oct that blew up on me, since the replacement i've had no problems. As I said previosly, this is an RLL controler.

1- Case : Just a plain old case, was used to hold a 4020 and a tape drive. The tape drive was torn out, I drilled some holes and soved in another 4020. I then took some glue and covered up the slot for the tape drive and sprayed the whole thing flat black. I then drilled a couple of holes into the front left and right to be used for the LEDs to sit in. A power on LED is stuck into an existing hole. (I just happened to glance over and notice that the power LED is not on so I either forgot to plug it in the last time i had it appart, or it burned out. I'll tose in an extra for free an let you fix it.) One future modification might want to be made, it is that the left 4020 drive seems to get hotter than the right. Some air cool vents need to be drilled in the underside.

1- Power supply : The old power supply that use to be attached to the back of the case burned out. I've upgraded to a 150 Watt (Overkill!) baby IBM power supply. Basical, I just let it sit beside the case with the 4 wire power lines going into the back of the pwere supply into the back of the case.

Thats it.

If you have made it this far, you are either interested or just want to see how your HD system compared to mine. If the later, "THZZZZZ" my is better, if not here is my price and conditions.

I'm asking $550 any shipping and INSURANCE charges get tacked onto the price which means it gets pushed over the $550 price. I will ship the HD system only with insurance. I'm scared when it comes to Hard drives and have seen some go out with the most miner bump while others could drop a foot and not even scratch the surface.
I've got both drives partitioned the same (16 megs storage & boot, 8 megs for my scratch files where i get down & dirty) I'll have to leave my partitions 'C' and 'D' alone since i dont want to go to the work of changeing my boot up, I will, however, load up my partitions 'E' and 'F' with PD software since I only used my second drive as a backup anyway this wont be a great loss and you can change it however you want it. (Gee, i've at least 9 megs of spectrum pictures i can give you!)
Warrenty: There is none! I'm shipping a working system and if you do something to break it, thats your own tough luck. That is why i'm insisting on insured shipping in case it doesn't work, it wont be my headache.
If all this seems like i dont want responablity if things dont work, your right, i dont have mega bucks such that i can take a lose of $550 bucks on non-working equipment.

PS: If you live close enought that you can drive here in a couple of hours i'll spend whatever time nessisary to get you familar with my HD system and even shoot the breeze with you for a while but just make it a weekend.

Opinions expressed are the responsibility of the author.

In article <6667@wpi.wpi.edu> jstorey@wpi.wpi.edu (John R Storey) writes:
>I'm writing a C program and have a small problem - I want to time how long
>a call to the Random ( ) XBIOS function. The problem is that I can't figure
>out how to time it in increments smaller than 2 seconds.

You don't say which compiler you're using, so this may not apply to
you. Mark Williams C provides a function called "clock()", which
returns the number of clock ticks since the system was booted. The
constant CLK_TCK encodes the number of ticks/second.

It so happens that the clock() functions uses the 200hz system timer,
so if you save the value returned by clock() (an unsigned LONG) before
and after the Random() call, and difference them, you will get the
number of clock ticks elapsed, more or less. Integer division by
CLK_TCK will give you elapsed time in seconds; modulo CLK_TCK gives
you the remainder in 5-millisecond ticks.

I would like to sell all of the following at once, if possible.
*Atari 520ST with TOS in ROM,
single-sided drive, and color monitor.*

*GTS-100 double-sided drive
*Supra Modem 2400 and Interlink ST
*Panasonic KX-P1091 printer; ST writer
*Digisound sound digitizer with software

plus software:
GFA Basic Dungeon Master
GFA Basic Book Sundog
GFA Vector Time Bandit
Music Studio Airball
Thunder! Hardball!

About 100 additional disks. They contain mostly digitized sounds, digitized pictures for Spectrum 512 and Degas, various utilities, and disk subscriptions to Start and Compute's ST (30-40 magazines included). Some of the disk are backups, and a few are blank. Most are double-sided.

Four joysticks are included along with a couple of Basic books and a nice wood disk container (holds 100).

All of the above goes for $1050.
Email is OK, but I'd prefer a phone call. The best time to reach me is between 8 p.m. and midnight. All offers considered.

From: kbad@atari.UUCP
Message-ID: <1966@atari.UUCP>
Source record: 244722

So, my argument comes full circle:

Z4648252@SFAUSTIN.BITNET (Z4648252) writes:
| Speaking of hacking...I am disturbed that Atari engineers feel that
| the home computer hacker, the guy who wants to software/hardware
| hack on his machine, no longer exits as a whole.

I rest my case that information distributed via networks such as Usenet can become mangled and twisted. I was the Atari engineer responsible for the Usenet articles claiming that Atari could not afford to support the average hacker at the level they need. One of my points was that the more stuff went out via "unofficial" channels, the greater the chance of it being warped.

I fully recognize the strong base of hacker types that own ST's, I do NOT think that Atari hackers no longer exist. Heck, that's how _I_ got started in programming!!! My point was (and is) that the majority of ST owners are not hackers. Atari, with its lean resources must use support who it can... professional developers and end users. People caught in the middle are unfortunately left to fend for themselves. Hopefully, Atari can come up with some reasonable guidelines for professional developers so that the information they have may be freely shared with the hackers who want it.

In the meantime, I and other Atari engineers will do what we can to give out what information we can here on the nets, despite the fact that it gets more distorted the longer it's out there. Sigh.

V067MAJP@UBVMSC.CC.BUFFALO.EDU (Arion) writes:
| What I don't understand is why don't the excellent development team at Atari
| just go ahead and make the changes and break all the programs that don't follow
| the rules.

Believe me, Arion, it's very very tempting at times. Especially when
you see some of the really silly things that some developers do to
break the rules. You want to punish them. But in fact, the end users
are punished worse if Atari breaks programs which break the rules. All
a user knows is that his favorite program doesn't work any more. If
the company that made it is no longer in business, that user is really
up the creek.

Fortunately, we are not constrained to strict compatibility with the
TTOS, so we may be able to fix some of the things we were previously
unable to fix.

Message-ID: <1968@atari.UUCP>
Source record: 244724

[wallace@oldtmr.dec.com (Ray Wallace) writes about solutions to the STE desktop.inf bug: edit the file or send off for MEDRES.PRG]

Once again, I have written a patch program which should be available at the same place you bought your STE. If it is not available, have that dealer contact their Atari dealer support representative at the appropriate subsidiary, and get a copy of STE_FIX.PRG.

Editing the file is not a viable solution, because that will mess up the desktop.inf file for other STs. The bug occurs when your STE _reads_ the desktop.inf file.

I'm having a problem with the MAS assembler that comes with Turbo C v1.1. The thing doesn't assemble, it just hangs the computer. This happens no matter whether I start the program from the environment, a shell (gulam) or the desktop (nov 85 ROMs, US version). If I give a bogus .s file name, it complains, and if I use the -V option it does print out its identification as expected, but nothing further happens[1]. Am I doing something stupid, did I get a damaged disk, or is this a feature :-)

[1] there is a second disk access in the first and third cases, I presume the seek for the .s file.

Using the GCC, I compiled Bison with very few changes necessary. I think
someone has ported it to Sozobon, and I know that John R. Dunning ported
it with an older version of the GCC; I think his version is available on
the terminator archive.

484. OPUS 2.2 is fine.

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 05:59:48 UTC
From: SCHMIDTM@CMR001.BITNET
Message-ID: <900116.01283012.062792@CMR.CP6>
Source record: 244728

I'd like to thank everyone for the help they've given
me in getting opus 2.2 to work properly, especially
Graham Thomas in the UK. With his help, I got everything
sorted out.

Here's what needs to be done:

1) The ASSIGN.SYS file that GDOS creates for you
uses 1-digit device numbers for the SCREEN.SYS driver.
These need to be changed to two digits with a leading 0
for OPUS to understand them properly. Thus, where GDOS
puts a line like:

4p SCREEN.SYS

you need to have:

04p SCREEN.SYS

instead. Now, ASSIGNER.PRG will run properly.

2) As the documentation suggests, OPUS is a big program,
and needs a lot of memory. When running FONTWID.PRG, the amount
of memory free for font usage is displayed as "workstation
memory". You have to make sure that the "font memory" it
displays after it has finished its work is less than the
"workstation memory" for OPUS to accept the fonts.
On a machine with more than 1 Meg it's probably ok, but
on 1Meg machine, you need to remove any fonts (for both
screen and printer together) that you can, until the
"font memory" is low enough. You can easily tell which
fonts are the largest by looking at the space they occupy
on disk. In my case, I kept only the ATSS fonts, and
everything finally worked. If you have too many fonts,
you will get the ubiquitous "screen and printer fonts don't
match" message.

OPUS has a really nice charting facility, and it's
worth it. I've found only two problems so far:

The first is of course the trouble in getting the fonts
set up right, and that fact that the shortage of memory
problem could be handled with a clearer message.

The second is that when you want to load a file, if the
directory pointed to has no *.OPS (or whatever) files,
opus seems to hang. This doesn't happen all the time, and

it may be the file selector, not opus itself. But if there's
at least one file that matches the selection criteria, it
works well.

A side effect of shortening the list of fonts is that now
I can get everything (G+PLUS, the fonts and drivers, and
OPUS with its files) on one disk, with the data files
on another one.

Thanks again to everybody! I hope this summary of my
experiences will help other people out there getting
OPUS up and running. Send Doug Harrison his $15 if you
like it; it's a great bargain!

485. "Floptical" drive info & a deal to get one cheap

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 08:58:24 UTC
From: unknown@ucscb.UCSC.EDU
Message-ID: <7222@lindy.Stanford.EDU>
Source record: 244729
Cross-posted to: comp.sys.apple,comp.sys.mac,comp.sys.amiga,comp.sys.atari.st,comp.sys.ibm.pc

First note: I ONLY READ comp.sys.apple out of the newsgroups I
posted this to, so a posted reply of any kind will most likely be missed.
Even if you did reply to comp.sys.apple, most replies would probably not
be appropriate for discussion on that newsgroup. I felt that this kind of
general info IS appropriate to post once. So if you have replies
PLEASE MAIL THEM TO ME OR THEY WILL GO UNREAD.

Technical information for the "floptical" drives I have talked
about recently. Note that these are MAGNETIC media and not the read/write
CD technology, such as in the drive that the NeXT uses... These use a
laser to read a special calibration track. So these are
not SMALL drives as a few people have told me. For a 3.5" disk, 20
megabytes (formatted) seems like a lot to me. "Floptical" is a registered
trademark of Insite Peripherals. More info at the end of the list.

I am going to show this as two separate lists as there are many
statistics given for one drive that aren't given for the other drive, etc.. You
can check for yourself and compare the few statistics that are given for both
drives.

INSITE I325/I325VM
CAPACITY unformatted 25 megs
formatted 20.8 megs

Recording density 23980 BPI (RLL)

Transfer from DISK 1.6 Mbit/Sec

Buffer transfer rate 2 Mbyte/Sec

Average Seek time 65 msec

Settle time 15 msec

Motor start time 750 msec

# of read/write heads 2

Track density 1250 TPI

Cylinders 755
Tracks 1510

Rotational speed 720 rpm

Power dissipation 6 watt average
11
Data reliability <1 error unrecoverable error per 10 bits

6
Seek errors <1 error per 10 seeks

Drive dimensions H: 1.625" W: 4.0" D 5.91"

This one is SCSI, supporting the Common Command Set (CSC), soft
formatting, error checking and correction (ECC), and defect mapping.
In addition, the I325VM (variable mode) offers FULL READ AND WRITE DOWNWARD
COMPATIBILITY with current 3.5 inch 720 kB and 1.44 MB formatted
diskettes.. {NOTE: I DON'T KNOW ABOUT 800K disks such as the Macintosh and
Apple IIGS, etc., use.. I'll try to find out more info}

Brier Technology Flextra BR 3020

Weight: 1.6 pounds

Power requirements (*)
DC Input +12 volts DC
+5 volts DC

Power dissipation <9 watts (operational-seeking)
* Power management algorithms reduce power to an average of 2.0 watts
for typical applications.

Both of the companies that sent me information said that they weren't selling directly to the public. Both of them, however, included information on the OEM pricing. Brier's pricing is $475 each for quantities of 100. Insite's pricing is $440 for quantities of 100 and they also have slightly stepped up prices for smaller volumes so if I can't get together 100 people this will still be a very good deal.

Here are the companies' addresses:

Brier Technology Insite Peripherals
2363 Bering Drive 4433 Fortran Drive
San Jose, CA 95131 San Jose, CA 95134-2302

If anyone wants to try to get in on this deal to get one of these drives cheaply, simply write me. My address is at the end of this posting. I have NO affiliation with either of these companies, I'm just very intrigued by this technology and want to try to get one of these drives at a reasonable price. Forgive me for any typos in this article.. I tried very hard to type in the data correctly, although I may have made an error somewhere.
--
If you want info about a 20 meg "floptical" drive mail me. YOU CAN ALSO GET ONE FOR --$440-- (NEW **LOWER** PRICE!) BY MAILING ME. [WE HAVE TO GET ENOUGH PEOPLE THOUGH..Slightly higher for less people but not much]
unknown@ucscb.ucsc.edu APPLE II FOREVER APL24VR GS tips? Mail me.
unknown%darkside.com@ames.arpa Please use the former address for regular use.

Well not quite. Some time ago I wrote a whole bunch of virus protection
programs.
Our darling little students keep bringing the little b*gg*rs in on their
disks you see. Anyway I haven't touched them in a while but most folk think
that they are pretty good so I'll post them to the binaries group.
One of them does flash the screen, but only if you run into trouble not the
other way around.

487. Help with Sozobon||

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 12:03:12 UTC
From: T6M-RIIT@FINTUVM.BITNET
Message-ID: <1037T6M-RIIT@FINTUVM>
Source record: 244731

Hi everybody!

I'm trying to learn C with Sozobon. I already got my *first* program
written and I've been trying to compile it with no remarkable success.

1) Tried cc:
cc hello
(why do the first programs always say hello?...)
A comment returned: can't find library 'HELLO'
No library found? Well, let's name one..
cc hello libm
- got the same line again.
OK, I'll give up.

2) Let's try the other way, do it piecewise.
hcc hello.c
goes fine. Got a nice assembly language file hello.s. But it sure
could use some optimization:
top hello.s
Yap, the file sure looks prettier (and a whole lotta shorter). Now
let's assemble it to hello.o.
jas hello.s
...the program spits out words of warning:
usage: as [-N] source [-o object]
and dammit that's just what I gave 'im, ain't it? (except the spelling
error - Joe's missing?)

3) Well well, there is still the make utility (the doc of which I just
can't understand and got no UNIX manual at hand). I cook up a file
called MAKEFILE with
hello.tos: hello.o
cc -o hello.tos hello.o
in it - copied straight from a USENET news article sometime in August.
Wonder if there's any sense in this... well, type make.
"No targets provided near line 2". I take the monitor and smash it on
the wall and eat the ST and go hang myself.

Now what the *ell (this does not mean Bell - hee haw haw..) am I doing
wrong? I am running a shell, PCommand, with environment variables LIB=
d:\sozobon\lib and INCLUDE=d:\sozobon\include (these shouldn't even be
needed if I got it right) and search path set to d:\sozobon;d:\sozobon\bin.
(\ is of course backslash no matter what it looks like to you).

Is there some kind soul who could shed some light on my ignorance;
especially about make.

488. ST then and now

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 14:31:37 UTC
From: cciolori@telesci.UUCP
Message-ID: <920@telesci.UUCP>
Source record: 244732

It has been a long time since I have worked seriously with my
ST. I got mine back in like '85 and I actually had to boot
TOS from disk! (Now that's an old ST)

When I went to college, it was mandatory to buy a Macintosh
(I attend Drexel U. in Philadelphia). This is one of the reasons
I haven't used my ST in a while. Actually having used the Mac
extensively for about 2 or 3 years, I have to admit that I still
have a yearning for the ST. The ST is just a great machine! And for
the price, you can't beat it. There were many things about the
Mac I liked(like a ton of FREE software put out by Drexel),but
I would much rather use the ST. It just beats the Mac hands down
in just about everything but market distribution. I am still annoyed
at the fact that there is no authorized dealer in my area.(I reside
in Atlantic City, NJ) It has been 4 or 5 YEARS since I bought my ST
and still no dealer! But there is something about that ST that
I love. (Besides I buy everything mail order anyway...cheaper!)

This brings me to the point of this posting. When I bought my
ST way back a million years ago, everybody told me I was crazy
because Atari would be out of business in like maybe a year.
And they are still saying it! Give me a break...5 years have past
and my ST is still humming along mighty fine. And Atari is still
in business.
I love the way these people give these stock quotes and use them
as a basis for saying Atari is going out of business. That's
EXACTLY the same thing they were doing 5 years ago, too. The way the
stock market is today, it is no indication.

SO please shut up! ST users are sick of hearing this! If you have
some useful stock info...fine, but don't come off saying that
because Atari has a quarterly loss they are doomed. Back in 1985
there were many people and analysts(analysts aren't people) who
predicted Atari and the Tramiels would NEVER pull it off...but
they did, and are still going. And I wish them the best of luck in
the future. Thank you Atari..for listening! I paid only $700.00
for my 520 when I got it...as compared to $1800.00 for my Mac SE.
The ST is as good or better than the SE, and this comes from
someone who has used both machines a lot.(And who likes his Mac)

Anyway, since I have been out of things on the ST for a while, could
someone give me some info on some descent software.
I am looking for a couple of good programming languages..C and
COBOL...some word processor stuff...games..data base..etc..

Chris

489. Re: Software from START

In article <25AEA403.23275@maccs.dcss.mcmaster.ca> johns@maccs.dcss.mcmaster.ca (Conan the Barbarian) writes:
> What about programs like GFA BASIC, and some of the other GFA
> stuff that was released on START issues? Is that PD, or do I have
> to buy a START disk?

GFA BASIC and the other GFA stuff on START disks are not PD. The only part of GFA BASIC which is distributable is the GFABASRO.PRG (the run-time program) so that people can run GFA programs without having GFA.PRG. You can't write programs with the run-time program, only run them.

The GFA BASIC related programs on the START disks do not come with more than rudimentary documentation, so you would probably have to buy a book which described GFA BASIC 2.0 as well. You can, of course, purchase version 3.0 of GFA BASIC, as well as the 3.0 compiler. If all you want to do is fiddle around a bit, you can get the January 1989 issue of START and the accompanying disk for version 2.0. If you want to do 'serious' work, you might wish to go with version 3.0 -- or forget about BASIC and work with C instead...

(I don't mean to imply that 2.0 can't be used for 'serious' work, but the lack of full documentation and the interpreter-only mode do make it harder on the would-be programmer).

Re: START
The best thing to do is to read the descriptions of the disks in each issue of START. Some of the "second side" programs they've been including are PD/Shareware, and most of them have already crossed the net and/or are available on one of the net-accessible archives. Over the past several months START has included the BSTAT statistical package and AniST, as well as ST Writer.

490. Looking for chassis-mountable monitor socket (and a plug!!!).

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 15:42:02 UTC
From: loki@moncam.uucp
Message-ID: <LOKI.90Jan16154202@marvin.moncam.uucp>
Source record: 244734

I've hunted ad nauseam for one of those twelve-pin monitor plugs/sockets. They don't seem to exist in the UK. Can *anyone* tell me where I can get them? I've rehoused my 520-ST, and I would like to take an extender lead from the old monitor socket on the motherboard to the chassis (I couldn't mount it flush to the chassis, you see). For this I need one plug and one socket. If they aren't easily attainable, can anyone offer me old ones that they no longer need (clutching at straws here I think...)

Also, is it safe to extend the cartridge port with a ribbon cable of, say, six inches? What is the maximum extension likely to be?

Thanx in advance.

491. TT availablity

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 15:51:20 UTC
From: rjd@cs.brown.edu
Message-ID: <25628@brunix.UUCP>
Source record: 244735

Well, ok...its time for *this* discussion again.

Does anyone have a semi-firm date on the US release of the TT? It
received a write up in STart, complete with a couple BIOS calls
and a photo, so I presume they got their hands on one somewhere.

I called my local Atari dealer in Warwick, RI and asked if he
heard anything: one guy laughed and said (sarcastically) "probably
just in time for Christmas, 1990." Unfortunately, knowing Atari's
past record, there was nothing I could say to him. He also
alluded to notion that an East Coast release would come long
after a West Coast and Mid-West release. Does that make *any* sense
to anyone?

Anyhow, I put my name on their (growing) waiting list, so I'll
get called when they finally arrive.

How about it Atari? Any ideas as to a date?

Also, one other question: how long after the US release will UNIX and
X Windows be available for the TT?

Thanks for any and all info...

492. Re: Help Needed with Atari H/W interfacing.

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 16:26:50 UTC
From: alex@athertn.Atherton.COM
Message-ID: <16686@laurel.athertn.Atherton.COM>
Source record: 244736

There was an article in START (like the first or
second issue), which discussed a novel way of writing
to the cartridge port; basically, it involved having
some decode logic in the cartridge which took an
address read by the user program, and turn it into
an outgoing data byte. Thus, if the user program needed
to _write_ a 0x5F to the cartridge, it would _read_ from
address 0xXXXX05F, where 0xXXXX was in the cartridge's
address space. The act of reading this address would
cause an output of that value to the device on the other
side of the cartridge.

One problem was that there was no addressing involved;
the device on the other side had to know where to stuff
that byte. I don't think it would be too hard to extend
the logic of the article to provide a limited addressing
capability as well (if I remember, there were 7 bits unused
by this scheme, so you theoretically could get 128 addresses
using an extension.)

Message-ID: <16687@laurel.athertn.Atherton.COM>
Source record: 244737

```
The difference between malloc() and Malloc() in Mark Williams
C is this:
Malloc() is the standard GEMDos memory allocation.
malloc() is Mark William's own version of malloc, which
basically tries to buffer you from some of Malloc()'s
oddities. The first time you call the MWC malloc(),
it does a GEMDos Malloc() of a bigger chunk than
you asked for, then parcels it out to you as requested.
For example, if you ask it for 10K, MWC will go out
and get (say) 32K, and give you a pointer to 10K.
Then if you ask for another 10K, it'll just give you
a pointer to another chunk of it's remaining 22K.
In doing this, you cut down on the number of calls
made to Malloc(), which is good, since Malloc() will
fail after some fixed (albeit large) number of calls.
(The Malloc() call limit can be raised by using
the FoldrXXX.prg program from Atari.)

I ran into this problem myself in a program I'm writing; I was
doing _lots_ of little malloc()'s (roughly 1K each), and I was
supposedly "running out of memory" _much_ sooner than I should
have. (I had 800K+ free, but couldn't get anymore). I put in
Foldr100.prg, and the problem went away. Another alternative
would be to use someone else's malloc() package; Dave Beckemeyer
has one on his BBS which you can tweak to the values you want.

494. Malloc() vs. malloc() (was Re: dissassembly)

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 16:58:16 UTC
From: steve@thelake.mn.org
Message-ID: <0016901058160832@thelake.mn.org>
Source record: 244738

[In article <1534@cs.rit.edu>,
ajy2208%ritcv@cs.rit.edu writes ...]

> I have Mark Williams C, and am curious: What is the difference between
> malloc() and Malloc() ????

Malloc() is a macro that expands to direct invocation of GEMdos function 0x48. GEMdos Malloc() is broken in several ways that *probably* won't bite you for what you're doing. (Some of these "pecularities" are documented in the MWC manual.) However, it's not as safe as malloc().

malloc() is a library call. Like Malloc(), it returns a pointer to a block of memory, or NULL. However, it does not directly call Malloc(). Instead, it is part of a complicated package of memory management code that Mark Williams Co. has written to work around the known bugs in the GEMdos Malloc() function. Each C vendor has had to implement such a scheme.

> I am writing a slideshow/picture viewing
> program, and when I used malloc() to get a 32k block of memory for a
> picture, the picture always had some stray data at the top (looked
> suspiciously like the other variables I was using).. However, when I
> used Malloc() this disappeared. Boy, I almost pulled my hair out
> trying to figure out what was wrong!!!

Remember that malloc() is not required to clear garbage from the memory block to which it points. If you need it cleared, use calloc() or clear the block manually.

If MWC's malloc() is indeed pointing you to memory that is in current use for some other purposes, it's broken -- but I doubt that actually is happening. MicroEMACS would die horribly. It's the malloc() torture test from hell.

Also, remember that you must point physbase to a 256-byte boundary (on the ST, apparently not on the STE), or strange things may happen:

```
char *ptr, *pbase;

if (((*ptr = malloc(1024*32)) == NULL))
panic(); /* allocation error */
pbase = ptr + (ptr % 256);
```

... then call Setscreen(). (Note that I'm mallocking 32 kilobytes, while the screen occupies only 32,000, so the pointer arithmetic is legal.)

Malloc is a C macro binding (in the file osbind.h) which builds a trap
to GEMDOS for memory its allocation function (0x48) in line. (Unless
you use the -VNOTRAPS option, which I don't recommend.) This function
takes a long parameter which is the size of the memory you want allocated
or -1L if you want to know the size of the largest chunk of memory available
from the system. The standard library function malloc() takes a single
unsigned integer (2 bytes) and allocates memory from the library managed
memory pool. If there is insufficient memory in the library managed free
pool, malloc() requests more memory from the system through a Malloc() call.
The MWC library function lmalloc() is similar to malloc() except that it
takes a long argument, thus allowing allocation of chunks of memory larger
than 64k bytes.

When using malloc(), lmalloc(), calloc(), lcalloc(), realloc(), and lrealloc(),
you free the memory with the library routine free(). When you use the GEMDOS
function Malloc, you free the memory with the GEMDOS function Mfree. Never
use free() on memory you've obtained with Malloc, and never use Mfree on
memory you've obtained from one of the library memory management routines.

This is all documented in the Mark Williams C manual.

The ST hardware enforces alignment restrictions on displayed memory.
Memory blocks returned by the MWC library allocation routines don't
necessarily conform to those restrictions, so it is useful to allocate
additional memory and keep an aligned pointer as well as an allocation
pointer. Use the aligned pointer in setting the physical screen base
and for picture reads. The XBIOS function Setscreen just truncates the
low few bits of the supplied address (actually, I think the retrace
routine does the truncation, but I don't remember for sure.) This
results in a lower address than that specified when given a non-aligned
address. These restrictions may vary between the ST and the STE/TT.

Also, malloc() does not zero out allocated memory, Malloc returns chunks
of memory which have most likely been untouched since the program was
started, which on some versions of TOS clears all free system memory.

I hope this all helps.

> Is there some kind soul who could shed some light on my ignorance;

The shell pcommand capitalizes all command line arguments. It is
a Messy-Dross command.com act alike command shell. I would assume that
sozobon is having problems with some of your switches because it is
looking for lowercase ones. On the environment variables, try including
a last '\' (backslash) some programs won't automatically add one I don't
use sozobon, so I don't know if this is happening.

Hope this helps

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Could someone tell me if I have a problem on my machine!?

I have a 520STFM upgraded to 1meg by my dealer. All the memory checks out OK using the memory check utility in the QMI deskCart!, so I know that all the memory is right but I find that I'm getting lines of fluttering on some dialog boxes, DCformat 3.0 being the first I noticed it. However to make it even more interesting the lines (about three of them on the opening dialog box) do not appear on the second box, despite it being positioned in the same screen location.

My dealer has offered to check over the video chips and inspect the soldering on the upgrade. Should I take up his offer? Can anyone point me in the direction of the possible problem? Apart from this, all is well, and I now don't know how I managed with only .5meg, heck I wont be happy until I have the big 4!! (And to think that I didn't know what to do with all of the memory in my ZX81 16K RAMpack years ago!!! :-)

Please could people answer to the net because the ukc node refuses to talk to my polytechnic, they haven't paid up :-(

Many thanks,

>
>It is.

More elaborately... There's only one set of data and control lines that
go to both disk drives. A particular drive is chosen by the proper number
(0 or 1) appearing on the drive select lines. (The controller is capable
of addressing 4 floppies, but there are only enough lines on the ST
interface to address 2. Oh well.) In any case, the Motor On command gets
fed to both drives, so both will start spinning. However, since only one
drive's "select" signal will ever be active at a time, the other drive
sits there, the light doesn't come on, it doesn't respond to other
commands, etc...

>operating system for the 8-bit computer.. A LOT of programs broke
>because programmers did not follow the rules...

So, make TOS 1.4 available on a boot disk. A LOT of XL Translators
were available to address the problem, and they usually sufficed, except
for the rare case where actual hardware differences got in the way.
(Like the XL/XE's bank switching in place of 3rd & 4th joystick ports...)
Why compromise when you don't need to - get the best possible system
into production, and release it. But make sure moving up to the new system
isn't a one-way trip - allow for using the old system when it's needed.

>used Malloc() this disappeared. Boy, I almost pulled my hair out
>trying to figure out what was wrong!!!

The MWC malloc() library routine uses MWC's own memory management setup.
Since GEMDOS's Malloc call is potentially dangerous, and the danger
increases as you approach 20 calls per program, the idea is to call the
system memory allocator as few times as possible, and to handle the
memory you *do* have to allocate by yourself. So the MWC library will
typically start up with a "heap" of, say, 64K, that is parceled out
to you whenever you use their malloc routine. If the heap is too
small to satisfy your request, the library will call Malloc to add
more memory to the heap.

As for the stray data at the top, perhaps you're not aligning the
screen memory correctly? And just as a side note... (Since I've spent the
past couple of weeks getting my favorite programs, e.g. Uniterm, working
with Overscan...) If you're writing code that you eventually hope for
other people to use, don't hard-code magic numbers like 32K into your
screen manipulation routines. [In fact, don't even use 32K. You only
need, at most, 32256, to get 32000 bytes on a 256 byte boundary, eh?]
Also don't assume that when you're looking at the default screen,
Physbase and Logbase will be identical. Retrieve and store them both,
when you want to do page-flipping.

While I'm up here on my soapbox... Here's some code to properly
align your screen memory. It seems simple enough, but I've seen it
done wrong too many times... [And hey, if you see that *I'm* doing
it wrong, let me know, quick, 'cause this is how I've been doing it!!]

```
In C: char *ptr, *malloc();
ptr=malloc(32256); /* for argument's sake */
(long)ptr+=255;
(long)ptr&=0xffffff00;
```

```
In asm I'd do something like
(Malloc returns to d0...)
clr.l d1
st.b d1
add.l d1,d0
sf.b d0
```

>a problem with FOREM ST more then your protocol. And I would like to add several
That's funny, I've sent & received mail to/from both of you.. }-)

I was wondering about that slow upload as well; I thought it was just me.
I added some patches to my copy of the sources (v1.62) for a number
of things, including RTS/CTS flow control (to use with my Courier HST)
and to use with Overscan. I also patched the Unix end to use with the
HSTs. (Since you want to do binary file transfers, you don't want to
have Ctrl-S and Ctrl-Q being anything special in the data stream. Since
Unix only offers Xon/Xoff flow control in the tty driver, you can run
into problems talking to an HST or any other high speed modem that
does data compression. If you *could* use hardware [RTS/CTS] flow
control on the Unix box, you'd be all set. This also is only a problem
when the Box talks to the modem at 19.2K,, and the modem can only
shovel bits out at 9.6K + compression. My solution [!??] was to add
an appropriate delay between packets that would make the total data
transmission rate from the Box to the HST correspond to about 11K,
which is what the HST's top speed is rated at. It sounds silly, and
is only about a 20% speed impreovement, but what the heck...)

At any rate, digging thru the sources in an attempt to find the
reason for the stop-and-wait upload behavior instead of the let-er-rip
behavior of downloads hasn't yielded any insights yet. Mebbe I'm
not looking at it right. Oh well...

Before you junk your Atari monitors, here's a final note on Overscan...
On my SC1224 (standard Atari RGB monitor) I get 720x280 pixels in medium
resolution. I like this A Lot. I don't know how much more you could
kick out with a multisync/multiscan monitor, but it better be a heap
more than that to convince me to shell out the $$$ for it.

On a side note... There's already a monochrome-detect line in the ST
monitor cable, and a "general purpose output" signal from the PSG.
Why not use that to trigger rez-change in your multisyncs? Then you
don't even need an external pushbutton; you could do it in a desk
accessory... (Control panel, change the GEM desktop, so it lets you
change rez right there, what-have-you.)

On December 27th, I posted an article about the "show and deliver"
policy of Atari's: New products will be shipped within 90 days of
an announcement. At least, this is what i understand Atari's "new"
policy to be. I gather the Dusseldorf "show" of August 25th 1989 was
NOT an announcement, as there are zero TT's being shipped to dealers
in Europe. I did get personal mail from an inside Atari engineer
saying that the Dusseldorf "announcement" stated a 1st quarter '90
release. We've still got 8 weeks or so before the end of the quarter.
However, the very same engineer made it perfectly clear that the TT was
still being designed. Furthermore, if one calls Atari Developer's
support, one discovers that the TT developer's kit is unavailable.
This all leads to very interesting and disappointing conclusions.

A friend of mine is visitng for a week to finish up a development
project we are working on together. He brought his Mac SE/30.
Very nice.. hmmm... and seeing how cheap these things are getting..
hmm..

>The symptom is a jittery screen display, but only the top half
>of the display is affected. The symptoms appear only after the
>unit warms up. The unit was rock-steady when new.
I have fixed several Monochrome Sm124 or SM125 models. I even have the
schematics for both of them. When I was having similar problems with
my monitor I found it was the IC that controls Vhold and Hhold. On some
models its the IC601. I found near the back of the unit when your looking
at it from the back. I simply replaced this IC and my problems were fixed.
This IC after a number of years causes several problems or symptoms

1) Mine had background was black with no checkers display and characters
were white.(looked terrible)

2) On other Sm124 or sm125's screen looked fuzzy and my screen after warmup
had the jitters Hhold or Vhold were out of sync? Well thats a guess.

So if your good at desoldering there are three to four ICs on the older
Sm 124's and one or two on the newer ones that I remember. Ps when I used
an ohmmeter on this chip all signals seemed correct. So I suggest you
concentrate on the ICs and the one in the middle towards the back is the
one I replaced on the older model..(ill dig up the IC number for you
when I get my schematics back from my former place of residence)

515. If your data rates are not excessive, you can write out

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 21:31:43 UTC
From: FTPAM1@ALASKA.BITNET
Message-ID: <9001170805.AA27127@ucbvax.Berkeley.EDU>
Source record: 244559

data serially, using one address line for the write enable signal and another for a single data bit. This is how the SmartWatch clock/calendar sockets work.

If you have enough address lines available, you could write out nibbles or whole bytes the same way. If you call the lower 8 address lines your write data bus and A8 your write signal, you could transmit bytes to your external circuit by reading from addresses xx100H to xx1FFH.

I have an microprocessor in circuit emulator that uses this technique to get at internal CPU information through a ROM socket. Its data rate is very slow, suitable only for single stepping and not real time emulation. The emulator can, however monitor bus traffic in real time. So when I need to examine a specific register in real time I insert a subroutine to read from FFxxH to signal the regiser contents.

Newsgroup: comp.sys.atari.st
Date: 1990-01-16 23:50:26 UTC
From: jg@hpldola.HP.COM
Message-ID: <11830071@hpldola.HP.COM>
Source record: 244567

I'm using MWC v3, when I malloc() all of the available memory my program recovers. But now when it calls fsel_input() to allow the user to save his or her data an alert box is displayed which says something like "system does not have enough memory for directory". How can I ensure that malloc() always leaves the system with "enough memory" to display the fsel_input() dialog box?

Also if there is such a technique, what is a good amount of memory to reserve?

Thank you for any help!

Hello,
This is my first message to this interest group.
Over the past 3 months,I have acquired a complete TeX system (TeX, LaTeX,
METAFONT) for the Atari ST. I acquired all the software from a mail-server
which is no longer operating (although still accessible via FTP) at
terminator.cc.umich.edu. My problem is that I lack a DVI to epson
printer driver. Such a program exists but I do not have access to FTP
(I have tried BITFTP@PUCC, but the arc'd files get corrupted).
If anyone knows of a mail server or if anyone could mail me a copy of
this program I would appreciate it.

Source record: 244570

Not to start a flame war, but would someone care to comment on the relative merits of Laser C and Mark Williams? I'd like to use the C compiler not only for program development on the ST, but also as a cross development tool for 68000 single board computers. I would expect Mark Williams can do this, being closely related to Unix, but can Laser C?
The ad on the box for Laser C promises fast compile times, but there's often a lot more to the story than the stuff on the box....
Thanks for the help.

528. Degas Elite and Timeworks Fonts

Newsgroup: comp.sys.atari.st
Date: 1990-01-17 01:23:07 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Jan16.204421est.57937@ugw.utcs.utoronto.ca>
Source record: 244572

With help from Greg Wageman and Rana Dutt (thanks, guys) I finally managed to get some of the fonts from Timeworks Publisher to load into Degas Elite. The results are not spectacularly better than the system font, but it does give better results at some type sizes, and character spacing varies to suit the character rather than being fixed.
I loaded the 'Swiss' fonts HPSS07AS.FNT through HPSS16AS.FNT into the folder with the other Degas fonts, and modified the assign.sys file (actually, the assign.ins file, since I'm using G+) to the list of fonts for the high res display.
Only 6 files could be added to the list before Degas would hang on booting up. You must reboot to see the effect of changes in the assign file, and double click on the text display box to select the typeface (not in the manual, Tom Hudson....). Now, these 6 files are all of the same type, so one could probably add more files of a different name.
The Timeworks files are on Disk 4, in the Part 6 folder of the Timeworks set.

530. EPROM Burners

Newsgroup: comp.sys.atari.st
Date: 1990-01-17 01:35:36 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Jan16.204649est.57977@ugw.utcs.utoronto.ca>
Source record: 244574

Anyone know of a good, inexpensive EPROM burner for the ST? I bought one for an (dare I say it here) IBM clone, was about $130, and it did very well for what I need. Unfortunately, the IBM emulators have no provision for plug in cards, sooo it looks like we have to buy a serial burner or something special for the ST. Now, serial EPROM burners generally come in at the price of a vanilla XT clone here in Toronto, so it would be possible to buy one of those and plug in the existing burner, but I get this terrible queasy feeling every time I start to use DOS. Hmmm, maybe I should adapt the one I use on my PET, the one that only burns 2516's and 2732's....
Any ideas, folks?
Thanks.
Peter

>

Personaly, i know of no way to put DM on hard disk. Theoriticaly it is
possible to make a copy that will run on hard disk but to the best of my
knowledge, no such program is on the market that will do this for you.
In some cases though there are two possiblities.
1)If it is a program that load in all parts of itself and need not make
further disk access, i've heard that switchback will let you put it on
hard disk. (Only hearsay, since i dont have it.)

2)Some programs are easy to modify the code such that it doesn't access
the disk for bad sectors and has files that can be moved to hard disk.
Unfortunatly this is time consuming and need some 68000 Assembly
knowledge. I am positive this can be done for Rouge, PC Intercom, and
Shanghia to mention a few. (This method is fun in itself since it has
a bit of challange to it with a visible reward afterwards. :-)

Hope this helped...

Jeez. I've never responded to my own posting before...

OK, true to my word, here we go:

ST Plus
P.O. 1197
Berkeley, CA 94701
1-800-759-1110

The product you are interested in is called The S-Tefax.

(BTW: It looks like ST Plus merged with a company called Zephyr.)

Anyhow, ST Plus seems to be a pretty good outfit. They sell *all*
ST products (hardware and software, and I *do* mean *all* products.)
They also take American Express, which scores big points in my book,
and they are prompt, and have decent return policies.

So, there you go...

>

The GNU project stands for "GNU's Not Unix." It is composed of
mostly volunteers, and overworked, underpaid hackers whose sole
purpose is to port the UNIX(tm) OS, environment and accompanying
utilities and tools into the public domain (with source code) on
a variety of platforms. They are basing their philosophy on the
old hacker ethic that knowledge should be free, and, to directly
oppose AT&T's "no source code" license, they are rewriting everything
from scratch and *giving* it away.

It's a monumental effort, but there are company's out there supporting
them. (Most micro computer and workstation companies have donated
equipment to the project...it's gotten quite large.) Anyhow, there
stuff seems to work fairly flawlessly. The have emacs, several compiliers,
and most utilities running on a large group of plateforms. Which bring
us to:

gcc - this is GNU's public domain C++ compiler. It comes
with source code for the Atari, and a Sun-Atari
cross compiler. C++ is *not* C, but a metaset language
encompassing most ANSI C syntax. The extensions are
in the areas of Object Oriented Programming (OOPS)
Systems. (MODULA is such a language.) These extensions
allow you to have several job processing running
"at once" (or seemly) by treating code functions
as OOPS objects.

We have gcc on the Suns at work, and it works quite well.
I just got gcc for the Atari ST, but I haven't gotten
around to installing it yet. It's quite huge. (With
source, binaries, documentation, cross-compilers, etc
if comes to a little over 14 Megabytes.)

Other C compilers you asked about:

Sozobon C: Another public domain C. And amazingly well
done. It conforms with K&R standards, and
supports GEM and AES calls. Its YAPAFS. (Yet

Another Piece of Amazing Free Software.) There
are a lot of talented people out there with
a lot of time on their hands!

MWC: Mark Williams C. This is a commercial piece of
software. It comes with a UNIX-like environmental
shell, and conforms (supposedly) to K&R. The two
people who I personally know who have MWC don't
care for it. I have no first hand experience with
it, so I can't judge.

Laser C: Formerly Megamax C. This is also commercial. Frankly,
I love it. It can either be operated from a UNIX
shell (golum works quite well), or from its own
menu oriented programming environment. Laser C
shines the brightest in this latter environment.
The shell caches your code and binaries during
the first compile/link stage. After that, it changes
only the modified parts of the source and binaries in
cache. The results are impressive. Huge (and I
am talking about 10's of 1000's of lines of code)
compile and link at blinding speeds.

It also comes with a debugger I've grown quite
dependent on.

Both Laser C and MWC sell for the $110-$140 range.

Hope this all helps.

[...informative stuff deleted...]
>
>As for the stray data at the top, perhaps you're not aligning the
>screen memory correctly?

This was a problem at first, as I am a beginning ST programmer and
am not a registered developer (yet.. :-). Of course, the people
who wrote the MWC documentation didn't bother mentioning the
fact that the memory has to be ALIGNED.. But they provided a nice
example, in which they aligned the memory, so that's how I learned..

>If you're writing code that you eventually hope for
>other people to use, don't hard-code magic numbers like 32K into your
>screen manipulation routines. [In fact, don't even use 32K. You only
>need, at most, 32256, to get 32000 bytes on a 256 byte boundary, eh?]

Kind of interesting, that the example in the MWC manual does have
32K hard wired in. Of course, it's only an example, but for someone
learning how to do something for a first time, it's not setting a
GOOD example.. sigh.. (at least it does have LOTS of examples)..

Thanks!

> OK, I'll give up.

You gave up two keystrokes too quickly. Try "cc hello.c".

If cc sees a filename with no .ext, or with .a, or with .lib, it thinks
it's a library. You said "cc hello" and cc looked for a library named
hello. It didn't find one.

This one has me stumped; I "jas source.s" all the time without any trouble.
If jas is getting a filename, it should assemble it.

As Bill Powers <powers@engles.enet.dec.com> pointed out, Pcommand may be
the culprit. It does some goofy things. Try gulam.

> Wonder if there's any sense in this... well, type make.
> "No targets provided near line 2". I take the monitor and smash it on
> the wall and eat the ST and go hang myself.

This, of course, is the primary purpose of make. By causing budding
programmers to smash monitors and hang themselves, the supply of
programmers is restricted, and salaries can be kept high.

Seriously, using make to maintain a program with fewer than half a dozen
source files is just a pain in the gazoo. Forget about make until you've
got C under control.

[In article <7503@shlump.nac.dec.com>,
powers@engles.enet.dec.com (Bill Powers) writes ...]
> On the environment variables, try including
> a last '\' (backslash) some programs won't automatically add one I don't
> use sozobon, so I don't know if this is happening.

Sozobon C expects that paths will NOT end in a backslash.

The source code for cc indicates these default search paths:

```
/*
* Default paths for executables and libraries
*
* Always check the root of the current drive first.
*/
#define DEFPATH "\\bin,\\sozobon\\bin"
#define DEFLIB "\\lib,\\sozobon\\lib"
#define DEFTMP ""
```

... so if the programs and libraries are on the current drive, you usually
don't have to define the environment variables. I often compile on D:
while the Sozobon directories are on C:, so I have set up:

```
PATH=.,\bin,c:\bin
INCLUDE=c:\sozobon\include
LIB=c:\sozobon\lib
```

>Yeah. And with any luck they'll *all* go out of business. Piracy
>has almost killed Atari...that's all that's needed is a thinly
>veiled software "rental" place.

Needless to say, it's extremely rude to call some people pirates
because they rent software. Libraries rent books, video stores rent
movies. Video stores rent Nintendo carts, which contain software.

In short -- piracy is an issue you deal with by educating users, not
by insulting legitimate businesses.

Btw, gcc is not a C++ compiler. g++ is a C++ compiler. gcc's feature is
that it's ANSI C.

Source record: 244585

Dear Gang,

I tried to post this once before, but the Janet->Usenet link seems a bit iffy these days, so I'm not sure if it got through. I never got a digest containing it at any rate....

1) I have an SM124 which seems to be slightly out of focus. I don't want to send it back because it's a replacement for a completely duff one (it's only two weeks old, by the way) so I thought I'd ask if anyone knows what to tweak inside top adjust beam focus.

2) I need a music printing program. Input - qwerty, output HPLJ+/HPGL/spooled PostScript. Piano music with included text if possible. Output should be of publishable standard. It doesn't have to drive a Yamaha 600 Turbo synthesiser or anything else fancy, just print music. Something like Music, the Troff preprocessor. (Are there PD versions of pic and troff for the ST?). Any advice appreciated. Replies by email, please, and I'll summarize back.

3) Summary of advice I was given on spreadsheets. Unanimous -

BUY LDW POWER. Simple, eh?

Well, that's all folks. Awaiting replies with baited breath.

> What is the difference between Sozobon, GNU (gcc), and C compilers
> like Laser C or MWC. Are they just different compilers or
> improved/modified languages. I've heard a lot fo talk about
> GNU stuff and was wondering what's the big deal.?

Well, they're all just compilers. But they all support different features. There are two standards for C; K&R first edition (the original book by Kernighan and Ritchie) and ANSI C, which is the new standard (and which is covered in the second edition of Kernighan and Ritchie). All of the compilers you mention are more or less compliant with K&R 1st edition, and they all have (different) extensions to it. The GCC also complies with the ANSI standard (and has extensions to *that* as well!).

I've used Laser, Sozobon, and the GCC. I only use the GCC now; I find the other compilers quite limiting in the features available. On the other hand, the GCC pretty much requires a hard disk and 2 megabytes of memory. If you don't have this much, you might consider one of the alternatives. Sozobon is a pretty decent compiler, and the price is certainly right. And the commercial compilers do have the advantage of better documentation and (often) nice graphics shells, if you care about that.

NO! What you describe is g++, GNU's version of C++, and not gcc.
gcc is an ANSI compatible C compiler. The Atari version of g++ is
available, but still somewhat buggy, I hear. The Atari gcc is (I hope)
no more buggy than the other gcc's, which is to say it has a few bugs,
but probably no more than commercial compilers.

Source record: 244593

The previous reply in this thread had an error and a statement I disagree with.
1)gcc is the GNU C compiler. It's available for the Atari ST, and is compliant
with the draft ANSI standard. There's also g++, the GNU C++ compiler, which
is not C, and if it's }iavailable for the ST, that's very recent.

2)I like Mark Williams C. The non machine-specific parts are pretty K&R
compliant. The library is very UNIX-like. The support people are great if
you phone (don't write--they answer in 3 months). The compiler is said to be
derived from pcc. The source and machine language debuggers work well.
Steve J.

549. For Sale: 1040ST w/Spectre 128

Atari 1040ST/Spectre 128 System Package $875 firm

HARDWARE
1040STFM no RF modulator (which means you can't use it with a TV)
TOS 1.2 1meg DS/DD 720K drive mouse original box & manuals
Z-time internal battery-backed clock (installed)
Atari ST Monochrome monitor
original box & manuals
Monitor Master (color/mono monitor select switch)
Custom cable for Multisync monitor
External speaker
(most multisync monitors have no speaker)
Spectre 128 Macintosh emulator cartridge w/128K ROMs
original disks/boxes/manuals
Translator One floppy disk controller
(reads MFS Macintosh disks in ST drives)
2400 baud Hayes-compatible modem
original box & manuals
Joystick

SOFTWARE
Atari ST
ST Basic/ST Logo/1st Word wordprocessor (came bundled with ST)
5 disks of PD software (C compiler, spreadsheet, terminal program, more)
Games (all original disks/boxes/manuals)
Beyond Zork (Infocom)
SpellBreaker (Infocom)
Plundered Hearts (Infocom)
King's Quest I
Phantasie I
The Bard's Tale I
Dungeon Master
Macintosh
Microsoft Word 3.01 (original box/disks/manuals)
original disks have been converted to Spectre format
Epstart Epson printer drivers
5 disks of PD software (ramdisk, DAs, fonts, games, sounds, more)

DOCUMENTATION
Abacus ST Internals
Abacus GEM Programmer's Reference
Inside Macintosh
(ancient edition in original Apple 3-ring binders)
30 issues of ST-log magazine

(from the original issue thru about March 1989)
Reams of printout from BBSes containing Atari technical information
(I collected do-it-yourself hardware modification articles, like
adding disk drives, attaching multisync monitors, expanding
memory, detaching the keyboard, etc.)

TERMS
I will not consider selling anything separately. Please do not ask.

In Northern/Central Jersey, you can pick everything up or we can

550. GNU and the ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-17 15:48:25 UTC
From: covertr@force.UUCP
Message-ID: <48173ae2.14a1f@force.UUCP>
Source record: 244595

You know, what with all the frustration with Atari not releasing the STe
to the US, and not releasing the TT to the US, and not having outline GDOS
fonts, and all of the other complaints that we have with Atari Corp-USA,
I started reading the Mac newsgroups. Well, I am a diehard STer, and the thought
of buying a Mac is almost enough to make me sick [:-)], but the support from
Apple is great (at least there are lots of 3rd party vendors for Macs). Anyway,
I am always looking for reasons why not to buy a Mac. My biggest are prices and
the poor system design centered about QuickDraw (very slow graphics on all but
the MacIIci). Also, Mac SW is VERY expensive. this is all leading to a message that
I saw posted in the Mac newsgroup. Someone there wanted to know why GNU/Free
Software Foundation hasn't ported their programs to the Macs. And another caller
posted a file included with GNU SW which really rips into Apple and explains
that FSF will NEVER support ANY Apple product, especially the Mac.
I have included the message for those who haven't seen it.

So, my point is that as bad as things are with Atari Corp at least ST is
is recognized by FSF as a machine worthy of porting their products to.
Most FSF programs have been ported to the ST. So there are *SOME* good
things about the ST!

Some time back, GNU got very upset at Apple over a lawsuit Apple tried against GNU for writing "look-and-feel" software; that is, software that "works even vaguely" like a Macintosh. Due to this, GNU doesn't support any Apple machines anywhere (especially the Mac). Pity, because the GNU software is not only excellent but free, and has source code and documentation provided. I'm not much of an Apple fan, and this certainly isn't the place to harp on Macs, so i'll leave it at that. Included is the "APPLE" file distributed with most GNU software:

@unnumbered Special Report: Apple's New Look and Feel

You might have read about the new look-and-feel copyright lawsuit, Apple vs. Hewlett Packard and Microsoft. Apple claims the power to stop people from writing any program that works even vaguely like a Macintosh. If they and other look-and-feel plaintiffs triumph, they will use this new power over the public to put an end to free software that could substitute for commercial software.

In the weeks after the suit was filed, USENET reverberated with condemnation for Apple. GNU supporters Richard Stallman, John Gilmore, and Paul Rubin decided to take action against Apple's no-longer-deserved reputation as a force for progress. Apple's reputation comes from having made better computers; but now, Apple is working to make all non-Apple computers worse. If this deprives the public of the future work of many companies, the harm done would be many times the good that any one company does. Our hope was that if the user community realizes how destructive Apple's present actions are, Apple would lose customers and have more trouble finding employees.

Our method of action was to print 5000 buttons that say ``Keep Your Lawyers Off My Computer'' and hand them out at the West Coast Computer Faire. The center of the button shows the rainbow-apple logo with a Gigeresque mouth full of ferocious teeth. The picture was drawn by Etienne Suvasa, who also drew the cover for the GNU Emacs manual. We call the picture ``Apple's New Look and Feel''.

We gave out nearly 4000 buttons at the show (saving the rest for afterwards). The result was a great success: the extent of anger at Apple was apparent to everyone at the show. Many of the invited speakers at the show wore our buttons, spoke about them, or even waved them from the podium. The press noticed this: at least one Macintosh user's magazine carried a photo of the button afterwards.

Some of you may be considering using, buying, or recommending Macintoshes; you might even be writing programs for them or thinking about it. Please think twice and look for an alternative. Doing those things means more success for Apple, and this could encourage Apple to persist in its aggression. It also encourages other companies to try similar obstructionism.

[It is because of this boycott that we don't include support for Macontosh Unix in GNU software.]

You might think that your current project ``needs'' a Macintosh now. If you find yourself thinking this way, consider the far future. You probably plan to be alive a year or two from now, and working on some other project. You will want to get good computers for that, too. But an Apple monopoly could easily make the price of such computers at that time several times what it would otherwise be. Your decision to use some other kind of machine, or to defer your purchases now, might make sure that the machines your next project needs are affordable when you need them.

Newspapers report that Macintosh clones will be available soon. If you must buy a Macintosh-like machine, buy a clone. Don't feed the lawyers!

Cheers

I really need/want a GEM Resource Construction Set Editor. I
have the one that comes with Mark Williams C, and the one from
HiSoft called WERCS, and an old one from Kuma. I like the WERCS
best, but it keeps trashing the HRD File for a very large RSC
that I am developing.

The HRD file in WERCS stores the variable names for objects in your
RSC. In my case I have about 8 dialogue boxes with many objects,
and lots of variable names. WERCS keeps trashing the HRD file and thus I have to
reenter the darn names!! Very frustrating!!! My copy was purchased in early 1989.
So it may be an old version. Could someone from Over The Pond tell me
what is the current version of WERCS?? I really like most of its features,
but the way it keeps trashing my HRD files makes it unusable.

HELP!!!!!!

P.S. I could write up a small review of WERCS if anyone wants one.

My children have broken their two First Byte games : probably by escaping to the desktop and having a mouse-button adventure with the file icons. I tried to write to First Byte at their old Long Beach, California address to see about replacement disks, but my letter was returned by USPS with the notation "forwarding notice expired".

Does anyone know FB's new address? Better yet, can anyone give me a hint on how I might be able to resurrect the programs? The original files are all there on each disk, but I suspect that they have been corrupted. The games in question are FB's "First Shapes" and "First Letters and Words". Thanks.

A coupel of years ago i bought an DELA Eprommer (Directly from DELA)
, the hardware in fact is prety good.
But the software is an other point, i'v got version 1.0 which can
burn eproms but can't make cartriges or even inspect the contents
of an eprom.
I know that there is an new version and i would realy like to have
it. There is only one drawback, if i order the update i get the
program for free from DELA, only i have to pay ~$20 !! to get it
into holland. So maybe there is somebody out there who already has
a higher version then i have i would like to mail it to me, or can
someone tell me where i can get whithout paying the $20.
Please mail.

>release. We've still got 8 weeks or so before the end of the quarter.
>However, the very same engineer made it perfectly clear that the TT was
>still being designed. Furthermore, if one calls Atari Developer's
>support, one discovers that the TT developer's kit is unavailable.
>This all leads to very interesting and disappointing conclusions.

At this point, I think Atari's policy should be to not say ANYTHING until a product is actually shipping. _Shipping_, not on the boat from Singapore, not in final FCC clearance, not in Beta sites, not prototyped, not in design; but really and actually going out the door to end-users or dealers or whomever. "This is our official announcement of model XYZZY. You want one? Call this number, give us a VISA #, and it'll be UPS'd to you the next day." No, I don't think all (or even most) companies do or should do this. But Atari has a lot of skeptics, including me. Maybe this would silence a lot of them.

Personally, I still don't expect to see a TT here, on the East Coast, until mid-summer at earliest. I hope Atari proves me wrong, of course, and ships the dang things next week, and they wow everyone & cause peace and prosperity & cost $500. :>

>A friend of mine is visitng for a week to finish up a development
>project we are working on together. He brought his Mac SE/30.
>Very nice.. hmmm... and seeing how cheap these things are getting..
>hmm..

I wish Apple and Atari (or someone, aka "Dave Small" perhaps :-) would get together to make low-cost, lower-end Macs. Let Apple chase the fast '030 and '040 designs, and let someone else make a Mac of reasonable performance that I can afford; say, an SE/20 for under $1500. (Oh please don't tell me about the Spectre GCR; I already know about it.) Just a wish.

556. STs and Colleges: A Proposal

Newsgroup: comp.sys.atari.st
Date: 1990-01-17 17:11:01 UTC
From: covertr@force.UUCP
Message-ID: <481784b3.14a1f@force.UUCP>
Source record: 244600

I have proposed this idea to John Townsend on GEnie
and both he and an Atari employee named Elizabeth Shook have
responded to it. But I thought that I would like to bounce it across
the USENET hoping that someone might pick it up and run with it.

Anyway, there is a lot of interest in UNIX and C at most colleges and
univeristies today. Most schools which teach Computer Science (comp sci)
also teach UNIX and C. And what is really needed is a Cheap, Hackable
UNIX machine. I have asked John Townsend @ Atari why Atari doesn't
bundle a Mega ST2 with a 65 meg drive, a monochrome monitor, and MINIX.
This package could be sold to college students across the USA at under
$2500. this would be the cheapest UNIX development system available.

MINIX has been ported to the ST, and you get full source code to MINIX.
Most, if not all, of GNU programs have been ported to the ST, and you get
full source code to them. So, for under $2500 the students would get an
excellent computer to do UNIX and C development, with one of the best
monochrome monitors ever made, and an adequate harddrive.

Atari would get name recognition in an important market. And would get to sell
a lot of Mega ST computers (before the STes make them obsolete :-)).

John Townsend replied that Atari doesn't have a sales force to handle
sells to colleges and universities. John also said that GNU software can
not be SOLD with a computer. But, I thought that if Atari *GAVE* the GNU
packages, with complete source code and instructions on how to contact
the Free Software Foundation, that GNU could be packaged with the MINIX/Mega
package.

John Townsend did say that Atari would work with any VAR who would like to
start such a program.

So, what is the general USENET concensus on this idea?? Would it fly??
Would it allow poor ($$) college student to buy a UNIX development
system cheaply?? Could GNU be bundled with such a system?? Does GNU
work under MINIX?

I think that the Mega ST would make an excellent UNIX hacking tool for
college students.

Regards Mark Williams C:
I have, use it, and like it a lot. It's a solid, professional
compiler with a lot of support and tons of documentation. I use it
with the Beckemeyer C-Shell, and in that environment, it's basically
like using Un*x. MWC has CSD which is their C Source Debugger, which
is great stuff; once you start using it, you'll be hooked. (You'll
need big chunks of memory, tho'...). I use MWC with a ram disc,
so all loads of the compiler, and all intermediate files go to RAM.
It's acceptably fast, although not as fast as Laser C. Anyway,
I just wanted to give my perspective, as a very satisfied user
of MWC.

Disclaimer: I don't work for MW, and I don't know anyone who does
(except their support people! :-)

> I don't carry any cargo, get into a fight, and then eject.
> I get my ship back just as before, but my status is still bad.
> What's going on?

I haven't actually tried it. However, the following is from my Elite manual, page 35, under "Escape Capsule" (grammatical errors are theirs, too):

"An escape capsule can be fitted in place of your cabin at any world of Tech level 6 or higher. If "Q" is then hit during combat the capsule will be jettisoned from the ship be automatically tracked by the nearest world and will travel safely to a Coriolis space station Your cash will be preserved but all your cargo will be lost.

"However, this item comes with a widely recognised insurance cover which will guarantee you a new Cobra Class ship, equipped in like manner. The contents of the cargo hold is exempt from this protection.

"Since the unique IR signature of a ship's hull is used to file police records, abandoning your ship in this way will have the effect (unfortunately exploited as much by galactic brigands as trader victims) of clearing your police record..."

Dear Netlanders,

This is not another attempt to sign-off via the list (I sent the request to listserv :->), but I want to explain why this list is no longer interesting for me.

For several years I have been reading all these must-knows from the knowledgable Net. However, since a few months the signal to noise ratio has dropped below the acceptance level (or I moved up the latter). Just browsing through all the junk costs me several hours per week, since we don't have kill files on BITNET/EARN.

I wish to thank all people who have made excellent contributions to the list and thus to my pleasure in ST programming. I also whish to FLAME those who merely post non-informative crap for just being there.

Some time I may return, when a new (moderated) list emerges that is mainly concerned with hardware & programming issues. Then I can read the Net AND do some useful programming after working hours.

Greetings,
Roger Hunen

Wouldn't it be nice if the ST had 256K of low power battery
backup up static RAM which could be write protected, instead of TOS ROMs.

You could load the version of TOS you needed for a particular
program. Total compatibility with all software.
Bug fixes would be easy.
(Just think, regular bug fixes and revisions of the OS
just like for real computer like our VAX :-))

Are there any technical problems that would stop you designing
a add in board to replace the TOS ROMs in this way?

I think this is an *excellent* idea. There are some problems, though.
I'd love to see a big Atari presence here in Ann Arbor, but I doubt it
can ever happen, the IBMs and Macs have been here too long and are
literally everywhere. Since most students have free access to the Mac
labs, very few actually need to buy their own systems, even though
indulging parents tend to buy them anyway.

The real problem I see here is that we've already got Apollos and PCs
and such up the wazoo. I don't know about other universities, but I'd
figure any other place with a comp sci/comp eng program is already in
the same position as well, i.e., they've sunk their money into other
hardware already.

Not to dampen the idea, it may still work. After all, the operating
systems classes here recently switched to using Minix on PCs. I think
the system you describe sounds ideal. Get programmers working on a
machine with a real architecture, as opposed to the silly 64K segments
you're bound to on PCs...

[Geeze, I guess I should get onto GEnie some more to catch this sort
of discussion... Sigh.]

So Atari doesn't have a sales force to do it, but would support someone
else's efforts, eh? Hm. It seems to me that you'd have to be at least
as large as Atari Inc. already, to be able to field all the support staff
that you're inevitably going to be called upon to supply. [The folks
around here bought into Macs big-time, sight unseen, because they were
reputed to be so user-friendly and intuitive. They figured they'd save
zillions by not needing to provide consulting/support services. They
learned otherwise, the hard way...]

Even if you present it as a hacker's system, you're going to get dubious
responses unless you can demonstrate sufficient competent support.
Dunno how you'll get that. It seems it'd take a big organization to even
get a U to start talking to you.

On the Subject of DM on a Hard Drive....

It doesn't appear possible, but even with software protection, it would have been SIMPLE, VERY SIMPLE for them to allow it. The data for the game is compressed, and is uncompressed at run-time. This is why it takes so long for the thing to load. All one would have to do is re-direct the I/O for reading this data to the hard drive and it would fly. They could then check for the presence of an original copy protected diskette in drive A and everything would be hunky dorey...

It's such an incredible game otherwise.....Sheeeeeeesh....

>I'm having a problem with the MAS assembler that comes with Turbo C v1.1. The
>thing doesn't assemble, it just hangs the computer. [...]
>Am I doing something stupid, did I get a damaged disk, or is this a feature?

As several people pointed out to me via E-mail (thank you very much), this is
a feechur.

Does anyone know if Heimsoeth intends to do anything about it? I'm not all
that upset, 'cause I have the tools to handle what little assembly work I ever
anticipate doing, but I did _pay_ for the thing...

Some people apparently noticed my US email address and wanted to know how I
got the thing. Not in the US, I'm afraid. I was in the Netherlands over the
holidays and used the opportunity to buy the program there.

Other than the interesting concept of assembly it has, I very much like the
package. ANSI C. _Fast_. Great work environment. Good docs. Truly excelent
help feature.

573. Re: STs and Colleges: A Proposal

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 00:53:19 UTC
From: squibby@eleazar.dartmouth.edu
Message-ID: <18582@dartvax.Dartmouth.EDU>
Source record: 244667

A couple comment on the ST as a college machine:
- I have been using a 520 for the last
four years (last summer mine un-GLUEd
so I did the trade in)

- The ST is acceptably cheap and public domain/
shareware make it a very useable computer.
I found I was able to do my lower division work
on it quite easily.

- The majority of college users will probably spend
most of their micro-computer time doing wordprocessing.
A simple user interface such as the Macinto$h has
real advantages over vi/emacs and TeX.

- The university I go to (UC San Diego) relies on Unix
environments for the majority of its teaching, so
an at-home UNIX box makes things nice, but the processing
and resources neccessary for the assignments would
severely tax any machine 1)running a 16bit bus 2)at <12MHz
3)without transparent virtual memory or extremely large
memory.

e.g.: A Data Structures Class uses C++ exclusively.
The G++ ST port document states that running
with less than 2 meg is right out and less
than 4 meg is silly. The assignment programs
require gigantic memory pools such that
virtual memory was a must.

- The College I am visiting (Dartmouth) does reccomment the
Macintosh and has instituted a gigantic Appletalk netowork
to support students using Macs. From an outsider's point
of view, learning programming on a mac seems like it would
unduly painfull (and possible leave the programmer with
misconceptions about programming larger systems). Yet this
is not an issue here, as most folks use their macs for
wordprocessing, spreadsheet work, macintosh mail and terminals.

The basic problem I see in this proposed package is that it artificially
tries to blur the distinction between a workstation and a powerful
personal computer. For a college or university to endorse a computer,
it would be necessary that that computer could be painlessly included
in a campus medium or high speed network (>100Kbaud) and be a good,
well-supported application box. For a college or university to endorse
a workstation, it would be necessary that that computer met the

above criterion and provide sufficient computing power to do school assignments. The ST fall short because: support is tough, GDOS is not as transparent as the equivalent function om the mac and there is little information on networking ST's.

One last note THEN I STOP RAMBLING:
The price issue is a strange one. Spending $2K for a mac makes sense at a school that provides good support for mac users and that is going to set you back $60-$80K in tuition over four years anyway. Telling students at a public university (~$2K /year in tuition) that whether or not they can afford a $3K computer will make a difference in their academic success has more ramifications that simply the which-brand question.

Yours in (unneccessary) verbosity,
Clark

>Nope. Copy protected software must be run off of floppy. Pain in the tucus,
>but that's the way it is...

Nope, thats not always the rule. For a vast majority of protected
software, one can place the program (providing the files are readable) on the
hard drive, and then use the main disk with the copy protection as a KEY disk.

There is also another alternative.

Get, Revolver. Then load the game in, and start playing, but when your done
just roll out the memory partition out to the hard drive. Admiditly this is
a kludge, but it is workable.

Hi. I looking for source code for a GIF file viewer. Any kind of source would be fine (C, Pascal, Assembly, etc.). I would like to work on a GIF file viewer for a mainframe system and I need some help. I have the GIF doc file that describes the file format, but I don't know about the LZW compression used within the file. Any help would be apprciated!

Richard has a good idea here, but there are a couple of other things students look for in a computer system. The most important is word processing. I figure that this system will probably be the only Atari product the schools will carry so it's important to include word processing software. The ST can use a standard parallel printer so that's not really a concern, but ST software can be tough to find, especially for students without cars.

The other thing people tell me when I recommend STs is that they can go to the library and print out their Mac stuff. Although this will probably not be acceptable to atari, the best way to get around that might be to donate a Mega 4 with a laser printer to each school you want to sell through. When I was at Stanford until last year, they said that they would have been happy to have STs in the library if Atari donated them as Apple had.

Finally, Atari will have to print a nice glossy brochure which illustrates why the Mega is the machine to buy. It should highlight emulation so students see tyhat even if the ST can't do everything they need, they can buy a Spectre GCR or PC Ditto and get one of "those other machines" even though they did choose an ST.

If the Tramiels ever saw how many Macintoshes people cart out of Stanford and UCLA's computer stores _alone_, they'd jump on this one! It just keeps gathering momentum too! If they have doubts, they can try it at a few schools and watch the success. The time to go for it is at the beginning of the academic year, though, I suspect.

578. Donkey Kong Junior arcade game boards

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 03:16:33 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1990Jan18.031633.1025@sun.soe.clarkson.edu>
Source record: 244672
Cross-posted to: misc.forsale,rec.games.video,comp.sys.atari.st

I have the circuit boards for a Donkey Kong Junior video arcade game
(also the manuals for them)

I want to sell them for $50, and depending on how far I have to send them,
I may even pay shipping.

The boards have been installed previously in an arcade machine, and I have
seen them work.

The manual includes info from play instructions to board components layouts
and components inventory to the board's pinouts and what it needs to operate.
I was going to get a power supply and hook it up to my Atari St's analog RGB
monitor (whose pinout matches the video game boards') and play the
game with one of my cheap joysticks.
A friend of mine verified that it would be simple to do, but I don't have the
time to try it, and I'de rather have cash at this point.

HELP!

I am building a drive for my ST: I am using an old xt case w/ 63 wattt power supply, Quantum Prodrive80, and an ICD host controller. I have assembled the unit; the drive powers up and the ICD format software boots the clock info from the host controller. The problem is, when the software scans for a SCSI device (the Quantum has an imbedded SCSI controller), it cannot find any SCSI devices. I know the drive works because I had a friend format it on a MacII and run a surface scan (and found NO errors). Can anyone think of a reasonable reason why the drive should not respond?

By the way, it DOES have the chip fix installed.

BIG thanks to anyone who can help me with this problem.

> gcc - this is GNU's public domain C++ compiler.

As far as I know, and I have a running version of it, GCC is a
(maybe only nearly) ANSI compatible C compiler. The C++ compiler
you mentioned, and which I have also running is called G++ and
a little bit buggy. Both compiler are planed to be merged, but
I haven't heared that this already happened.

> The extensions are
> in the areas of Object Oriented Programming (OOPS)

The program, Atari Planetarium is an excellent source for longitude
and latitude data, is gives locations to quite a number of cities
around the world.

It also gives you celestial coordinates for selected stars.

Anyone know the coordinates for Sacramento, CA?

As a college (like most) that spends time every year trying to guess what platform to place out on campus, I can tell you that the proposal could not fly here. I like my ST. The price//performance ratio is great and I can amaze people here at Carleton with some of the things it can do, at the price it can do it for.

Right now, the Atari is a hackers company and the ST is a hacker's machine. One of the major criteria here is company support and reputation. Atari's troubles in both areas would be enough to throw out any proposal. Another area that the ST would have trouble in is networking. Most colleges consider a machines ability to fit into future networking (ethernet, primarily). Yes, the Atari can be 'made' to do a lot of things, but I would not think there would be very many computer center staffs willing to support that type of environment. If Atari were to concentrate on the Educational Market and prove that it would support the colleges, then OK. But right now, IBM, Apple, and HP are the major players in the market, with Commodore beginning to show more interest (and support). Atari is making business decisions that may be good for the company, but it just happens that they are un-fortunate for educational institutions.

Like Richard, I am always looking. The longer it takes for Atari to move on from the ST in the US, the more USers they will lose to others.

A recent issue of "Doctor Dobb's Journal" (don't remember the date) had
a reasonably good description of LZW compression, with code. Check your
library.

You could also look at Unix compress, since it uses LZW. If your site doesn't
have source, check out the nearest comp.sources.unix archive.

I think we should sell ST's to college students as just plain word processors. I am a creative writing major, and I know that dozens of writing majors buy Macintosh computers every year because they like the easy mouse interface. I suppose that they think the ridiculously long time it takes for the Imagewriters the buy to print is normal, as well as the price they pay. If they had ever seen an Atari ST, and were informed of the student price of WordPerfect, I think it would be dozens of easy sales over the course of a month.

Although I haven't had any significant usage of Laser, I have used MWC extensivly and have been very pleased with it. My understanding (from other people's benchmarks) is that Laser compiles faster than MWC but the final code from MWC runs faster. I can't confirm or deny this myself (I believe the benchmarks were in an ST-Log or Start or some other magazine.)

One thing I can say for sure, MWC has some of the best reference docs I have ever seen. (Although they may be confusing if you don't already know C and want a tutorial.)

I am really amazed by the total gall of some people. This guy is asking a lot
of bucks for a used machine. What with the STe coming out (at least in Canada)
used 1040STs are going to sell for a dime a dozen!.

In article <10630@thor.acc.stolaf.edu>, pritchaj@thor.acc.stolaf.edu (John Pritchard)
writes:
>
> Atari 1040ST computer for sale
> ------------------------------
>
> Don't let the name fool ya, this is a heck of a machine.
^^^^^^^^^^^^^^^^^^
Right, until you can buy a 1040STe that is!!

>
> --1 meg RAM, expandable to 4 megs
^^^^^^^^^^^^^
Geez, that is standard in a 1040ST!

>
> --built in ports for modem, printer, ext. hard drive, ext. floppy
> drive, MIDI in/out (great for MIDI people)
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Oh boy, more standard features!

>
> --internal 800K 3.5" floppy drive
^^^^^^^^^^^^^^^^^^^^^^^
Well, at least the guy didn't strip out the floppy drive!

>
> --COLOR Monitor
^^^^^^^^^^^^^
Hot damn, a color monitor!! I wonder if it is the Atari or some
cheaper Thompson type monitor.

>
> --external 50 meg hard drive
^^^^^^^^^^^^^^^^^^^^^^^^^^^
Oh boy, again no details. How old is the drive?? what was it used for??
Who made it?? Which host adapter and controller is in it??
Does it even work?? Heck, Jack doesn't say a "working" drive, just a drive.

>
> --image scanner that attaches to most popular printers
^^^^^^^^^^^^^^^^^^^^^

Oh good, a $100 item. Really adds value to this system!

>
> --manuals and cables for everything
>
> --system is mouse-based -- similar to a Mac in operation.
>
> --great color graphics on this thing. Mac-heads may not care about
> this, but people with vision love it.
>
> --includes heaps of software for word processing, desktop publishing,
> graphics applications, music, MIDI, games.
^^^^^^^^^^^^^^^^
Would be nice if Jack said which software he is including. Or does Jack simply
mean that lots of SW is available?

>
> --with a little extra hardware, this computer can run Mac software
> faster than a Mac SE, and PC software faster than an IBM AT.
^^^^^^^^^^^^^^
Well, let's see. Spectre 128 = $170, MAC 128K ROMS = $150 total = $329
Spectre GCR = $299 MAC 128K ROMS = $150 Total = $449
PC DITTO II = $300

>
> --Dealer and user support in Mpls/St. Paul and all other large cities
^^
Jack, is that a promise?? Have you investigated " all other large cities"?
How can you make such a statement? Especially to "comp.sys.atari.st"!

>
> Please help a semi-impoverished college student survive!
^^^^^^^^^^^^^^^^^
Sounds more like a Used Car SalesSlime to me! If Jack can sell this 1040ST
for $1500 I should let him sell my 3 year old 520ST also!! Heck, I have
upped it to 1 meg, it has a color monitor, and an 85 meg drive. So, I should
get $1500 for it, right??

> This entire system for sale for the amazingly low price of $1500.
^^^^^^^^^
Oh wow!! And after you pay Jack $1500 I have a bridge to sell you!

> (Any reasonable offers will be considered, of course)
>
> Jack Nutting
> c/o Carleton College

Gowd, I can't believe this. I can buy a brand new 1040ST with color monitor
for about $800, and get a brand new 85 meg FAST FAST (28 ms) hard drive
from TOAD COMPUTERS for about $709. And if you wait a couple of months you

will be able to buy a new 1040STe for the same price.

My feeling is that a used ST is worth at max 50 cents on the dollar versus a new ST. So, I wouldn't offer this guy more then $700-$800 for his system, including the color monitor and the hard drive..

Another thing, whhy did Jack go into so much detail describing basic features of the ST?? Doesn't Jack realize that this is "comp.sys.atari.st"? What does Jack think, that we don't know what a 1040ST is?

A shorter ad would read:

Used 1040ST, color monitor, printhead image scanner, 50 meg hard drive
With manuals
$800.

See, 3 lines says it all.

People like Jack should read more articles from this newsgroup before posting. A small little ad is more effective then this long bloated ad!

> Steve J.

I too like MWC. I have been using it for 3 years now. MWC does require a hard drive, but any serious programmer is going to have a hard drive anyway. And as I use UNIX at work, I fit very well with MWC's msh.

And the best thing about MWC is its manual. I am still learning things from it. Also, MWC has an 800 technical support phone number (though I don't remember it right now). MWC has always been very helpful in answering my technical questions.

Plus, you can buy the source code to the MWC Libraries. So, you can see what the differences between malloc() and Malloc() are!

So, if you are a UNIX programmer I would recommend MWC. If you are a novice C coder or just have a floppy drive I would recommend Laser C.

597. Help needed in writting my debugger

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 16:34:35 UTC
From: bds@lzaz.ATT.COM
Message-ID: <913@lzaz.ATT.COM>
Source record: 244690

I'm attempting to port my Minix debugger to TOS, and I'm having a difficulty
that perhaps some TOS guru can quickly identify for me. Consider the
following pseudo-code fragment (taken from memory):

```
Pexec(LOAD-DON'T-GO,...)
move user stack to static buffer
Pexec(GO,...)
Cconws("Program terminated.")
...
```

This code works fine: program starts up, proceeds until requested to exit.
Now consider the following:

```
Pexec(LOAD-DON'T-GO,...)
save registers and insert breakpoint at start of loaded program
move user stack to static buffer
Pexec(GO,...)
Cconws("Program terminated.")
...
break entrypoint :
Save registers and restore debugger's registers
...
return to process entry point:
Save registers and restore process's registers
RTE
```

(I've ommitted obvious details like setting up vectors etc. I'm using
a trap #0 instruction for the breakpoint.)
The above code works great (breakpoint hit, additional breakpoints can
be set, process can be single stepped, etc.) but when I "continue" the
child process the system locks up at the point that the child should exit:
i.e. in Pterm() (and no "Program terminated" message is seen).
Since I'm using a local stack arena to do the Pexec (which shouldn't
get trashed), and the process executes just fine after returning from the
debugger, I don't understand the lock up at all. The test program can be
as simple as:
main() { Pterm0(); }
I've also tried calling a C function that in turn did the Pexec
(to make sure the base register was set up correctly). Any suggestions?

IMGCAT, as well as a dozen other excellent shareware programs are available
from Chet Walters, POB 45, Girard, Ohio 44420.

Demo versions of some of the programs are available, and I can post some
to the binaries group if there's no objection.

I don't have the titles right here, but the programs are:
Catalog IMG Files
Catalog Degas, Neo, Tiny files
Catalog PrintMaster files
Convert PrintMaster files to Degas (puts 40 icons on one screen)
Stitch-X - converts Degas pix to cross-stitch patterns

and a bunch of others. They are all of excellent quality. You won't be sorry
if you plunk down some cash sight-unseen for IMGCAT and the NeoStag (his
user's group) utilities disk.

I think Mr. Demillo has a very valid point there. Besides the 3 Atari dealers we have in this city of approx. 300K, we have a few MIDI dealers, and another dealer who does not carry the Atari line anymore. It is known as a Computer/Electronics/Software rental store. I think that is their term for "We pirate while you wait." I've been there and seen first hand how people who work there make copies of software either for themselves or friends.

Thankfully, Atari refused his request to become a dealer, and his stock of ST software is abysmally small.

>In short -- piracy is an issue you deal with by educating users, not
>by insulting legitimate businesses.

Are you sure that the 12v portion of the power supply is sufficiant for the drive? Does it sound like the drive spun up? You could check the 12v and 5v supplies at the drive.

Try replacing the SCSI cable and/or ohm it out for continuity and shorts. Even if it ohms out ok the connections at the connectors may make and break when the cable is move. Meaning, replacing the cable is the only sure test.

603. FSF Anouncement (was Re: GNU and the ST)

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 17:57:41 UTC
From: canada@crash.cts.com
Message-ID: <1219@crash.cts.com>
Source record: 244695

Actually, I've been meaning to post the following request for a while but I forgot... Richard Covert's posting jogged my memory.

I've been writing for the FSF for 2 years now (GAWK manual, GNU operating system manual, BASH manual) and all that time was using an Atari ST to do the writing (and the corresponding testing of the FSF software). Until a couple of months ago, fellow FSF'rs would look at me incredulously when I told them I was using an ST to do the work. They wanted to know when I was going to buckle down and get a ``real'' machine. Well, that was before they realized that I was using GNU Emacs ON AN ST!!

The Free Software Foundation has now discovered the power of an Atari ST and they are amazed and pleased. They are especially pleased to discover (to their *great* amazement) that most of the FSF software has been ported to the ST. Everyone has been especially pleased with the quality of the ports.

Richard Stallman asked me if I would make the following announcement:

If you have ported any Free Software Foundation to the Atari ST line of machines, and you would like to see that software *officially distributed* by the Free Software Foundation, then please write to rms@wheaties.ai.mit.edu. Send a copy of your ported software and a letter requesting inclusion into the standard distribution (or mention this announcement).

What do you ``get'' from having your software officially distributed? The ``fame'' and the ``glory'', :-); as well, it becomes easier for you to update your version because you will get updates ``first''.

If you are interested, then I encourage you to write rms. I am pleased to see the ST finally recognized (and amused -- 2 years!!). The quality of the ST ports is one of the (perhaps *the*) highest of all of the independent ports of FSF software.

VOLUNTEER WANTED: As well, I am looking for volunteers interested in porting the Bourne Again SHell (BASH) to the Atari ST. Brian Fox, author of the BASH shell, is impressed with the amount of FSF stuff available for the ST and has offered to assist anyone wanting to port BASH to the ST. I'm currently writing the manual for BASH, and I must say that it is a pretty good shell (combines the best of Bourne and Csh, with bits of Korn thrown in). If you are interested in the ``job'', please send me (Diane Close) e-mail.

604. TOS executable file format

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 18:05:27 UTC
From: mtp@ukc.ac.uk
Message-ID: <3651@harrier.ukc.ac.uk>
Source record: 244632

Does anyone know the exact format of executable files? The initial 20 or so bytes are easy to decypher but I cannot find any information on the layout of the symbol table and especially the relocation information.

I am trying to make a program to run TOS executables from within MINIX which looks fairly easy except for actually producing an executable image in memory from a mysterious .ttp file.

Any information would be usefull.

Matthew

605. GNU-Emacs 18.55, binary patch #1

```
/*
[Please don't ask me where emacs is, it's posted and will come soon!]

This is the first (binary) patch to my last release of GNU-Emacs for the st.
Yesterday i discovered this nasty little bug in the timer routines for emacs
and i found a rather short solution to patch it.
Although you might not have received the posting yet, please keep the
appended little C-program. Then after you got the posted version of temacs
compile it and run without parameters to patch temacs.
The corrected bug may never hit you (it's hard to reproduce and *very* time
critical), but if it does, hours of work may be lost.

- Edgar
*/

#include <osbind.h>

main()
{
int fd;
short patch_area[16];

if((fd = Fopen("temacs",2)) < 0) Pterm(1);
Fseek(232092L, fd, 0);
Fread(fd, 28, patch_area+1);
patch_area[0] = 0x40E7;
patch_area[15] = 0x4E77;
Fseek(-28L, fd, 1);
Fwrite(fd, 32, patch_area);
Fclose(fd);

I found in MWC , using TOS 1.4 that there are still only a small finite number of Malloc calls allowed (20 min, 32 max).

What MWC did is make the clicksize, that is the size asked for from Malloc user adjustable.

When I ported STEVIE to the ST, I first find out how large the file is, and set the clicksize to about 1/16 of that size. Then malloc() calls Malloc only about 16 times. Works great.

It happens to me as well, but its the other way round. ie.
access B --> A spins, access A --> B doesn't spin.

>Nothing to worry about; that's what they all do.
>

I'm not particularly worried about it and I haven't had any problem for the
last 3 years. But the annoying thing is that my A drive is the SF514 which
is 10 times nosier than the B drive which is a cheap 3rd party mechanism.

Just wondering, is this phenomenon by any chance the result of the fact
both drives are sharing the same power supply? or may be because they
are (not properly) daisy-chained?

> I am seeking information from users of a product called SWITCHBACK,
> made by a company called Alpha Systems. Specifically, what programs
> work with it, and which don't?

All my programs work with it.

Switchback sets up an interrupt from the line printer port. When the button
is pressed is activates a TSR program that saves the WHOLE ram image, and
allows it to be restored.

Programs that will fail to work with it either:
1. have been cludged to screw the printer port to do in Switchback OR
2. load into all of memory. Thus a Game the you BOOT never gets to TOS
and never gets the TSR program loaded.

Most if not all copy-protect schemes deal with loading and starting the
program. Once they are running, the key disk is not required.
Thus Switchback works well, as it saves the running program after the
copy protection testing phase.

>reason why the drive should not respond?

From what I gather it sounds like you may have your device ID set wrong on the
hard drive itself. Make sure its set for drive 0, as most drives start there.
Your software on the ICD host adapter at the bottom right hand corner tells
you what device # your give to your drive. I think it starts at 1. Regardless
just reread everything on the Device ID in the software manual. Also SCSI
imbedded drives have to use the SCSI drivers made specifically for this drive.
It doesnt work the same as the regular hard drives that come with external
controllers, from what Ive heard. So call ICD Technical Support and they
will give more help as well. Sometimes if its not an ID or Driver problem,
look at your cabling and make sure you have hooked up J0 on the host with
your hard drive, and not J1 as so many mistakenly do. Last of all if all
else fails reconnect all cables, making sure for proper connection.

Dave Tomesch, PS. Tell ICD Mr. Fusion sent you! Ask for Howard.

This is a stupid line of reasoning. The purpose of a graphics system that can display 16 million colors is so that you can display full color images without having to resort to dithering, custom color tables, etc. One doesn't need to show all 16 million colors at the same time, as long as you can make each pixel on the screen any color you want.

Also, you can get graphics cards that provide 16 million colors on a 640x480 screen for about $800-900. So a 24-bit color Mac II can be had of a reasonable price.

>fortunate for educational institutions.

Well good news for you then. StarTrak a local company is working on a fast
multi-Dma newtworking for the ST that is lowcost (100 or less,thereabout).
The way it works is several STs can be hooked up together to one Hard Drive.
(Eg. I have a 250MEG hard drive that I want Two STs to access simultaneously,
or as close to simultaneous as I can get. One ST runs a BBS the other is
use for professional programming, yet both use the Hard drive info at the
same time.) This has already been accomplised no big feat! However after
several years of research and totally wiping out several 16 meg partitions
in the process, I have come out with a way to do it cost effective and
yet Multi-DMA. If all goes well, I will finish writing it in assembler
and it will be available to the public. The reason it can be considered
a networking feature is that all rs232 ports can be used at the same time.
An interesting side-kick to all this was I had Two BBS's running off of
one Hard drive at the same time. When one person finished writing his
message the other person on the other line could read his message he just
saved one second earlier, kinda wierd when you see it work. There are
other similar systems but I have never heard of any Multi-Dma type before.

If anyone is interested call me voice sometime. I wont tell you how I
managed to do it but Ill give you more info on availability.

Make sure you've set the jumper to disable parity. I don't have a manual handy, so I don't remember which pin it is, but I had this exact same problem with my Quantum when first trying to install it. The ST doesn't use parity on the SCSI bus, but many devices have parity enabled by default.

615. ST pictures on laser printers

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 20:30:58 UTC
From: daroloson@watmath.waterloo.edu
Message-ID: <33376@watmath.waterloo.edu>
Source record: 244605

Does any one know of a program to dump Degas, Neo, or other format colour ST pictures to a laser printer?

Since a laser printer has higher resolution, it should be possible to get a better quality picture than from a dot-matrix printer by simulating a larger grey scale.

Also, are there utilities to print ST pictures, DTP pages, or other ST graphic output using a UNIX mainframe to an imagen300 or postscript laser writer.

6 months old Atari 1040ST...works perfectly...for sale. Upgrading to Mega2
or Mega 4. Need the money. Bought for about $950 6months ago. Selling for
$699. Since i will need the monitor with the next computer I can also sell
the ST alone for $499. (includes all original packing books disks and mouse)

Send email or call 212-749-1155 or 212-666-5555.

617. Book Publishing on Mega STs

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 20:42:23 UTC
From: ia4@cunixd.cc.columbia.edu
Message-ID: <2643@cunixc.cc.columbia.edu>
Source record: 244607

I am upgrading to a Mega computer for a small book project. The hope is to publish a small book in A5 size (is that half of A4?) so that two pages per A4 sheet are printed out on the laser printer. Planned font is Avant Garde (Mac-like) or something similar.

What hardware software setup would do the job?

Thanks

Imran

<learned that the new Dartmouth students (freshmen) were
<being handed Macintoshes at registration. THey'd pick
<up their class schedule and a Mac Plus. THe cost
<was built into the tuition.. though one was not
<officially obligated to purchase a Mac.. 97% of the
<entering students in fact did go home with one...
<(perhaps a current Dartmouth student can confirm this).
<

You want a Dartmouth student to answer this? You must be kidding.
I am it. As far as I know I am the only person at Dartmouth (I am an employee)
that knows what a 1040st is. In fact the bookstore (remember it?) used to
carry Atari hardware and now they bairly have any software. There are two
shelves (sparse) for atari stuff (st and the 800) and 3 shelves for C64 stuff.

:(:(

I am not really picking on you Kevin... I am just frustrated here. I feel like
an island. I don't even know where to go to see a dealer.

And Kevin, if you come up for a reunion I can provide you internet access and
maybe a place to crash.

dav

P.S. To answer your question:
Yes, something like 97% of the students have macs. In fact, when I got here
I was told that because of the public clusters and machines in faculty offices
there are more macs at dartmouth than students. Something like 10% of the
students buy two macs by the time they graduate. (they can sell the old one
after 2 years).

>Does anyone out there in netland know of the proper parameters to
>pass for the AES function APPL_FIND? I am a starving...

The format of the appl_find function is as follows:

```
int appl_find( name )
char name[9];
```

name is the name of the application you are trying to find, without the extension and all in upper-case letters. It is always 8 characters plus the final null character. (eg. if you are looking for 'example.prg' then name should point to the string "EXAMPLE ". (don't forget the blank character to pad it to 8 chars.)

This info is a paraphrased version of the description given in the Mark Williams C Manual.

I have used neither, but I do now that any program compiled with Laser C crashes on my systems because of an innocent program in my autofolder which translates bombs into readable messages and is perfectly legal. Dunno what they do in their start-up code, but it ain't pretty.

On a related note, does anyone know why all compiled GFA-2 basic programs hang the machine when executed from a shell (my shell?) about 2 times out of three?

Geert Jan van Oldenborgh

623. IBM PC / ATARI ST Disk Screwed Up

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 21:58:49 UTC
From: ia4@cunixd.cc.columbia.edu
Message-ID: <2646@cunixc.cc.columbia.edu>
Source record: 244612
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

Here is a simple problem :-)

I use an Atari 1040 ST on which I can prepare and save text files on PC format 720K 3.5" disks. These I take to school and use them in the NCR PCs there for printouts as I have no printer :-(

Recently the school added some HP PCs with 1.4M 3.5" floppies. There seems to be a compatibility problem as the 1.44M drives do not read 720K floppies made on the NCR PC compatibles (or my Atari ST).

One of the staff there solved the problem by "Formatting a Low Density 3.5" Disk on a High Density Drive" command available in the menu. Sure enough, the floppy formatted as 720K on the 1.4M machine worked fine on the 720K drives including my Atari ST drive.

So I spent the whole night typing some reports and saved them on this floppy. The next day, at school, I had to use the 1.4M drive PC as that is the one connected to a Laserprinter. But, surprise, that very drive that had formatted the disk showed it to be blank (even though the files showed up on the 720K drive PCs). It simply said, File Not Found.

What could be the problem?

But wait. That is not all :-(. I then typed a small note on the PC and when I tried saving it on my disk I got a Disk Error 27. Checking the disk on a 720K drive showed that the directory had been corrupted. Some of the files I had created just did not exist anymore :-{. Also the bytes remaining number showed up as ^&%#$&($&*$&) or something. And a few files with similar garbage names showed up. But when I tried to delete or open them they were "not found".

I took the disk home and used a disk doctor type program to read the sectors. I found that most of the matter for my files was still there on disk eg from Sector 118-120, #140-149 etc. Also, the program has an option to recover files accidentally deleted by making their names again visible in the directory. But this program failed to do so. Checking the first few sectors of the disk showed that: Names of exisitng files are saved on those sectors, names of files delete d by me show up but with a Hex E5 replacing the first letter of the file name, but the names of my three lost files donot show up at all. Hence the program cannot recover them.

My question(s). Any idea of what could have happened? Solution?

Also, is there any PC utility I can use that helps recreate files simply by allowing sectors to be linked even if the filename is missing from directory?

Any help will be appreciated. I also wonder if other people have had this problem.

Imran Anwar

625. Jclock auto program fix (programming question)

Newsgroup: comp.sys.atari.st
Date: 1990-01-18 22:00:46 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1990Jan18.220046.3795@sun.soe.clarkson.edu>
Source record: 244614

I have been using JCLOCK.PRG in my auto folder for quite a while, and I love
it. It's a corner clock that changes resolutions with you, a capslock
indicator and is easily enabled/disabled via key combos.
BUT I hate the fact that it waits for a return from the keyboard while booting.

I have disassembled it, and found where it input from the keyboard:

```
H42A:
move.w #7, -(a7) * 3F3C 0007
trap #1 * 4E41
addq.l #2, a7 * 548F
rts * 4E75
```

Quite straight forward. Push C_RAWCIN function call, call function,
then "tidy" stack and return.

I would like to change it to essentually:

```
H42A:
move.l d0, xxxxxxxx
rts
```

This would cause it to return with a "return." But my problem is that I
don't know what value is being returned for that key by the C_RAWCIN function.

Could someone CODE this little subroutine AND include the HEX so I can use
a disk editor to change it?

I will try to figure out how to post the result once I get it working.

>

Sorry, Greg...I stand by my claim. And the Federal Trade Commission stands with me, I'm afraid. (As does STart, BYTE, PC Week, etc. They no longer accept advertising from software "rental" places.)

Your analogies do not hold. If books were as easy to copy as software, you can bet there would be similar complaints. In the early 80's, record rental places were outlawed by the FBI because of record piracy. In the latter half of the 80's, the same complaints led to delays on DAT recording media. Video rental stores were also under attack for copying, but as it is more difficult to copy a video tape (not everyone has two VCRs) the losses were considered minimal. Rental of Nintyendo game carts is legit since not that many people have ways of reading the ROMs or EPROMs, let alone copying them. If there was such a way, you can bet that you wouldn't be able to find Nintendo at your local video store.

Computer software is (currently) the *easiest* media to copy - and your copy is an *exact* duplicate, not some scratchy re-recording of a record. I have been to a total of 15-20 different software "rental" places, and *every* last one of them made no bones about the fact that "whatever you did with out their knowledge was none of their concern."

Frankly, Greg, I consider it *rude* to steal. I am a professional programmer, I work *hard* for my money. If I want to give away my code, fine...if some tries to "rent ity," I'd be on their back with a pack of lawyers. If you don't think piracy has wounded the software industry - look around.

Atari software, by the way, is acknowledged as being the hardest
hit. Atari roots are in gaming (regardless of what we all pretend),
and certain gamers (not all) find absolutely nothing wrong with "lending"
copies to their friends. And, if you can lend out "Joust,"
why not Lotus 1-2-3? Atari users even had access to "thru the mail"
software "rental" agencies. The user never even had to see the
owner of the store, let alone account for his/her actions.

>In short -- piracy is an issue you deal with by educating users, not
>by insulting legitimate businesses.

I agree completely. And don't believe I have insulted legitimate
businesses. If you want to see a piece of software run, go to
a store and ask the proprieter to start up a copy for you. I have
never been refused this request.

>

Source record: 244621

Rich Covert asked how to format 3.5" floppie's on the ST for compatibility with
with Apple File Transfer. I've found the best way to do this is to use the
Mac or a PC to format the floppy. The ST has always been able to read Mac
or PC formatted floppies for me. You can format MS-DOS floppies in Apple
File Exchange if you insert an unformatted floppy while in the program.
Just make sure you use a DSDD disk or else the Mac will format it at 1.44Mb.

I haven't had a chance to experiment with various ways of formatting with the
ST. I wonder if the twisted format that the Mega roms use would confuse
the Mac?

Regards,
Marcelino Bernardo

634. STE questions?

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 00:51:31 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1990Jan19.005131.16601@newcastle.ac.uk>
Source record: 244638

Question 1.

Are the SIMM modules in the STE of a standard type, as I have seen an ad for SIMM modules for these machines ...

Amstrad,AST,DELL,EPSON,EVEREX,HP,INTEL,IBM,SUN... etc of the following types.

```
Memory X bits Speed
---------------------------------
256Kx8 100ns or 80ns
256Kx9 100ns or 80ns or 60ns
1Mx8 100ns or 80ns or 70ns
1Mx9 100ns or 80ns or 70ns
4Mx8 80ns
4Mx9 80ns
```

So which of these are of use and how can I mix them. I know the STE has four SIMM slots. I think the 520STE (yes ATARI UK are shipping a 520 version) has boards in all slots (is this 128Kx8 ?). To install these I assume it is simply a case of plug in and go.

Question 2.

I have heard that the STE can access more memory than the ST. 8mb was quoted by a person at Third Coast. Is this correct? Does this meen that each of the SIMM slots is a seperate bank? Could I put 4 cards of 4Mx8 and get 16M of memory? So how does TOS 1.6 access its memory?

Question 3.

A FOFT (friend of a friend tale) has it that there are already two versions of the STE. One for the 520STE and one 1040STE. Is this true? If so why the difference?

The STE is a great machine and deserves to do well, anxiously looking forward to the TT. Keep up the good work Atari.

636. What do I need to use TEX?

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 01:18:56 UTC
From: clubok@husc4.HARVARD.EDU
Message-ID: <1301@husc6.harvard.edu>

Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

Hello, all. I am trying to get TEX working on my system. I got sttex.arc
(or was it texst.arc) from terminator, and was disappointed to discover
that it contained no docs. So now I need to know:
1)Which .arc or .zoo file contains the documentation?
2)What other files will I need to get TEX working?
3)Is it even feasible to use TEX on my system? (I have 1 meg, 720K
floppy, RGB monitor, and Deskjet. I know the Deskjet is no problem,
but the memory and disk space might be.)
Any help is much appreciated.

Indications that I have been given from a friend whose relative works for Word Perfect are that we will not see a version of 5.0 for the ST. I would not hold my breath in view of the long time it took to first get a reasonable version of WP, and then to get a 'bug-free' version.

While we are on the subject, anyone know a _good_ book and/or a source of PD source code for doing basic natal chart calculations, especially planet positions and house cusps (under a variety of house systems). I though the ANTIC program wasn't accurate enough, and the one books I have is in BASIC and the code is quite spaggetti. Any help will be appeciated.

Thanks in advance!

639. Gfa 3.0 help

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 02:20:12 UTC
From: skn@mentor.cc.purdue.edu
Message-ID: <6518@mentor.cc.purdue.edu>
Source record: 244626

I've got a question, about the FIELD command in GFA Basic 3.0.
I'm trying to use the FIELD command to save some strings of data.
Below is a section of code to save some strings.

```
' ********************************************************
OPEN "R",#1,"OBJECTS.DAT",5602
FIELD #1,1 AT(*vertices_adr),1 AT(*faces_adr),1600 AT(*x_vert_adr),1600
AT(*y_vert_adr),1600 AT(*z_vert_adr),200 AT(*point_a_adr),200 AT(*point_b_adr),200 AT
(*point_c_adr),200 AT(*face_color_adr)
FOR loop%=0 TO number_of_objects
vertices_adr=VARPTR(vertices|(loop%))
faces_adr=VARPTR(faces|(loop%))
x_vert_adr=VARPTR(x_vertice(loop%,1))
y_vert_adr=VARPTR(y_vertice(loop%,1))
z_vert_adr=VARPTR(z_vertice(loop%,1))
point_a_adr=VARPTR(point_a|(loop%,1))
point_b_adr=VARPTR(point_b|(loop%,1))
point_c_adr=VARPTR(point_c|(loop%,1))
face_color_adr=VARPTR(face_color|(loop%,1))
PUT #1
NEXT loop%
CLOSE #1
' ********************************************************
```

This code is suspose to create a file OBJECTS.DAT. This code
seems to work alright. The code to read in the data is the same
except instead of a PUT statement there is a GET statement. The
data read in is scrambled, if you have any suggestions it would
be a great help.

Thanks, Doug

It is obvious to me that Jack is trying to sell to someone who knows nothing about how little ST hardware costs brand new. I mean, compared to a Mac, his system looks pretty cheap! I guess the big mystery is why would he post his ad in the ST section, where everyone already understands enough about the ST not to get tricked. Incidentally, I have discovered that Jack plans to buy an Amiga with his $1500 (laughter).
Alas, I too am selling my ST. Trying, that is. Please check message #13666 (fabulous number, isn't it) and tell me what you think of the price. It seemed like a bargain to me, perhaps I am just trying to sell too many things at once. Go ahead then, buy JUST what you WANT. Give me an offer. If I have anything left to sell by Tuesday, I will fall off the face of the EARTH!

642. Shareware MICRO RTX

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 05:06:56 UTC
From: david@bdt.UUCP
Message-ID: <874@bdt.UUCP>
Source record: 244636

I am sending a SHAREWARE version of the MICRO RTX multitasking operating system for the Atari ST to comp.binaries.atari.st.

I don't know for sure if Steve accepts shareware or not, but I guess we'll see.

This distribution includes the full 80 page programmer's manual and RTX bindings for "C". The basic registration fee is only $35.

The following is a press release that I'm sending out. Press 'n' now if you don't like this sort of thing.

********** A N N O U N C E M E N T **********

SHAREWARE MULTITASKING MICRO RTX FOR THE ATARI ST!!!

(OAKLAND, CA) BECKEMEYER DEVELOPMENT TOOLS has released a version of their multitasking operating system, MICRO RTX, as shareware for the Atari ST line of computers.

MICRO RTX is a fully multitasking real-time operating system which adds multitasking extensions to TOS, Atari's native operating system. MICRO RTX can run standard TOS and GEM programs without modifications and offers additional operating system services for applications, such as interprocess communication, installable device drivers, file and record locking, device control, real-time prioritization of tasks, efficent memory management, event signaling, message passing, and much more.

Full programming documentation is included with the shareware version, including source code to "C" bindings for popular Atari ST "C" compilers.

End-user registration is a modest $35, which includes the program disk and printed manual. Full developer status with technical support services is $75. An advanced commercial version which includes an unlimited binary redistribution license is $250.

643. TURBO-C Question!

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 07:37:34 UTC
From: joep@tnosoes.UUCP
Message-ID: <671@tnosoes.UUCP>
Source record: 244639

I'm trying to compile 'BISON' on my ST using the TURBO-C compiler. After
a few changes the compilation was successful, but the linker still gives
some weird errors.

On standard C-function like 'free' I get:

"16 bit PC relative overflow"

When I change the order of the linked files, some other functions
are listed. The linker is trying to call the function
using relative addressing and sometimes the function is simply
to far away.

How can I solve this problem without changing compiler? Is there
an option that I don't know.
Or SHOULD I use another compiler? The only one I'm prepared to use
is the GCC-compiler. But will this compiler work correct on an
1MB atari.

There are no problems. Such an add-in board exists. It is called ROMSIM
(ROM SIMulator) and was a project by the German computer magazine c't.
You can buy the pcb only, a complete kit or a finished board from various
sources here in Germany. I can dig out details if anyone's interested in
ordering one.

It seems that ROMSIM never made it into the US.

>

I've had all sorts of bizarre problems with PCs and compatibles not being
able to read each others' disks. We have several dozen PCs at the Star
Tribune, and I don't trust them as far as I can spit. Perhaps it's a drive
alignment problem, or perhaps it's that PC disk controllers aren't very
smart. The 1.44MB drives have a reputation for being even more flaky than
the run of the mill when asked to read/write 720K disks.

On the other hand, just this evening I copied the DeSmet Personal C
compiler and some source code off my ST's hard drive onto a preformatted
720K 3M Corp. disk (from a good Minnesota company), took it to work, stuck
them in a couple of '286 and '386 PS/2s with 1.44MB drives, and ran the
compiler just fine.* So PCs and clones can work when they want to. (Sorry;
I know that doesn't help.)

--
*This is not to be taken as a suggestion that I think the DeSmet
PCC is worth the price of a floppy disk, let alone the shareware
fee. Sozobon C has spoiled me rotten.

>the company that made it is no longer in business, that user is really
>up the creek.

I would like to see all the bugs fixed too. I admit though that it would be a
shame to lose the use of some programs because of it.
Why not have a bug-installer that puts back the necessary buggy behaviour
(stop laughing!) so that these programs can work.
eg. I ran an old game on an STE and it bombed out. So I dug about my disk box
and pulled out RAM loadable TOS 1.0. Hey presto the game now works.

I may be getting TOS 1.4 soon (though don't hold your breath folks:-).
TOS 1.4 has the I/O redirection handling bugs fixed so you can redirect the
output from any program. But developers have to use 'isatty' stuff so that
their programs work on 1.0 and 1.2 so there is not really a big win here for
them. Likewise with Malloc.
Because of the existance of bugs in the old ROMs most developers don't use
those system calls but cook up their own routines.
Sometime ago before TOS 1.4 was released Allan Pratt said that he had fixed
such and such bugs and that a patch might be about 30K. Why not release such
a patch that fixes all the bugs and make it available for dealer distribution.
Not enhancments like Move File and Rename Folder etc just the fixes.
That way developers can rely on TOS 1.4 and users without it can either get the
chips or the bug fix.
TOS 1.4 ROM sets being as widespread in the UK as they are tends to make me
like this idea a lot.

>Fortunately, we are not constrained to strict compatibility with the
>TTOS, so we may be able to fix some of the things we were previously
>unable to fix.

Great! Does that include the lost 2 clusters?

The Austin Code Works, of Austin Texas, sells code for MS-DOS systems.
Their listings can be found in some MS-DOS related magazines, and, if I
recall correctly, either C Programmer's Journal or Dr. Dobbs.

Among their listings are disks with geographic data bases on them.

649. METAFOUR hard drives

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 14:17:45 UTC
From: 870086t@aucs.uucp
Message-ID: <1990Jan19.141745.18123@aucs.uucp>
Source record: 244640

hi everyone
Has anyone ever heard of or delt with METAFOUR MARKETING out of
Edmonton, Alberta, Canada. They sell custom harddrives. I just bought
a ST157N with a Supra interface, a 3.5" floppy and a 200w(a bit exsessive
I know, but that is standard in the setup) all in a case designed to fit
under the monitor. It also has 4 outlets so you can plus the rest of your
equipment into the drive unit.
Anyway I ordered the drive back in August by fax. First they lost
the fax, so I had to order it by phone(since I no longer had access to a
fax machine). When the first one arrived by courier it was totalled, they
must have run into it with a forklift or something. A month or so later
I recieved a replacement, by Canada Post, it too was damaged (but only
cosmeticly. So I contacted METAFOUR and they said they would send me a
replacement cover for the drive rather than risk further damage shipping
the entire drive! Made sence at the time, however that was 2 months ago.
They tell me they have shipped 2 covers and cannot understand why I have
not received at least one of them. A third is on its way, who knows where
it may end up.
METAFOUR tells me they have a good track record shipping all over
the country, but what do you expect.

My question is has any one ever had the problems I am having and
if so any suggestions as to what I can do to protect my investment.

Thanks in Advance

From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9001200805.AA01354@ucbvax.Berkeley.EDU>
Source record: 244642

To All Netters who wish to use TeX on the ST

Current Notes Magazine for December 1989 has an excellent article on TeX for the ST. They also have five discs in their library that represent the distribution kit including LaTeX, MetaFont, SliTeX, PicTex, and (I think) BibTeX. The discs come with documentation and examples for their use.

There is no doubt that TeX is the best tool available on the ST for doing any kind of publishing that involves a substantial amount of material, such as software manuals and books.

Horace Mitchell, the author of the piece, did an outstanding job of putting all of this together and providing extra documentation.

Current Notes can be reached at 122 N. Johnson Rd, Sterling, VA 22170. Phone: 703-450-4761.

I helped Horace test out this distribution and I am satisfied that it mill meet the needs of most Atarians.

If this is interpreted as a commercial message, so be it. I can assure you that no one is making any money off the deal. This magazine exists to help Atari users.

653. Aegis Animator

Newsgroup: comp.sys.atari.st
Date: 1990-01-19 15:56:04 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Jan19.110305est.57398@ugw.utcs.utoronto.ca>
Source record: 244644

I bought Aegis Animator some time ago for an animation project I was doing for a local museum. Not bad, but the animation script language was much more useful than the GUI that is the main part of the package. The animation script language is not that well described in the manual, so I worked backward : look at the results and then examine the scripts to determine how the script works.
Anyway, I have the manual and would be willing to make copies for people, now that Aegis is in the public domain, providing this doesn't violate the copyright and especially that it doesn't interfere with the author's royalties .
Any comments on this, pro or con?
Peter

Now that a multi-tasking TOS is available, perhaps it is time for someone to try to add a windowing system on top of it, like Desqview for the IBM, which allows different kinds of programs to run in windows, GEM or TOS programs alike? (GEM is so stupid that this windowing system should be on top of GEM, that is, it will allow GEM windows and other junks to be inside the new windowing system's window....)

At Indiana University we use the ST1040 for assembly language programming. In order of importance the reasons we got were
1. There was information available about enough details of the hardware and operating systems.
2. In has a 68000 CPU.
3. The price was right.

We also use Minix in the operating systems course, but that is done on clones of IBM I believe.

And where IS the proper forum for discussing the selling of Atari computers in colleges? I personally enjoy seeing these discussions, and feel that this is a good place as any for it. I also find the use of the command 'K' to be handy when something bores me. Why don't you just skip over those topics?

Speaking of drives here a special note to those who want cheap 3 1/2 inch
drives. Electronic Stores in toronto(Active Surplus and Computronics) are
selling brand new 3 1/2 inch drives for 49.95 canadian. Thats right
90 day guarantee and can be put into 520 Single sided ST machines.

I plan on getting one sometime if anyone out there is interested a new
shipment of 100 just arrived. My Nec for instance formats to 85 tracks
no problem. I get about 960 K in 11 sectors format and 800+ in Ten and
have little problem with either. So go out and buy a cheapo before
they are sold out.

From: alex@athertn.Atherton.COM
Message-ID: <16863@laurel.athertn.Atherton.COM>
Source record: 244511

Well, the first thing you don't want to do is to malloc()
all of the currently available memory. Doing this (as you've
found) is a good way to cause things to lock up, because other
applications (the desktop is one) need free memory, too.

In addition, when you malloc() all of free memory, you're making
the assumption that you're the only process running, which
may or may not be true. What if you have desk accs running?
What if you have a multi-tasking system? You haven't left any
memory for anybody else. Not nice.

As for how much memory you _should_ reserve, this is kind of a
tough question, for it depends very much upon what your application
is doing. I recently wrote a cardfile database that mallocs()
memory; in my case, I malloc() only the amount of memory that
I need in order to fit that card into memory. This has advantages
and disadvantages:
1) The advantage is that I only take a little bit of memory
from the system each time (I actually take a bigger chunk than just
a single card, because the MWC malloc() routine carves out a medium
sized chunk from GEM, and then parcels it out to me). Thus, any
other application which is running can still get memory if it needs
it.
2) The disadvantage is that because I make a _lot_ of mallocs(),
I have to use folder100.prg in order to increase my memory pool size,
otherwise I run out. (That's not really a big disadvantage).

In other words, it pays to behave nicely in the system, and use only
those resources that you really need right now; don't assume that
you're the only application that's running, and don't assume that
just because you got back NNNN bytes free from Malloc(), that you
can therefor grab NNNN bytes from the system.

In a spirit of purpouse stated so eloquently above Steve forgot to tell you one small thing. :-). A white space between left margin and "cc" on line 2 in your makefile does not consist of blanks, but IT HAS to be a TAB character (0x09, ctrl-I). This is a misfeature on an original Un*x make and got stumped generations of beginning C programmers. I guess that we are doomed to live with it, like with segments on PeeCee. Otherwise your makefile is fine (it is using built-in default rules to produce .o files from your source .c).

The fsel_input() needs a minimum of 3K of memory in order for
it to come up. The more the files in the directories, the more the
memory that it needs to allocate.

I don't exactly know what MWC v3 does with its malloc().

I would assume it works under TOS 1.4. Dave probably uses MICRO RTX
in MT-C Shell, his multi user multi tasking kernel. MT-C Shell works under
TOS 1.4, as I use it.

IMHO - Dave writes good stuff.

It turns out that I can not get ARC 6.02 to work with any of the graphical shells I have for ARC (ARCSHELL, ARCGSH21, UNARC). All of them produce either two or four bombs (it keeps changing) when they go to execute ARC. The older version of ARC (v5.21b I think) runs fine with all of these shells.

Has anyone else had trouble with ARC V6.02 running under these shells? I assume it is working for most people since no one else has mentioned the problem.

>My feeling is that a used ST is worth at max 50 cents on the dollar versus a
>new ST. So, I wouldn't offer this guy more then $700-$800 for his system,
>including the color monitor and the hard drive..

Yes, this is also what happened before the Mega ST series came out.
The 1040ST and 520ST prices dropped precipitously. You couldn't GIVE them
away. You couldn't sell new or used 1040ST's (okay, okay, it was difficult).
And then an amazing thing happened. The Mega ST series arrived.

And then people realized that 1040ST's were still worth something.
And prices went back to their original levels (more or less).

So, you see, even if the STe is God's own favorite computer, a price
of $1500 for a used 1040ST with a 50M hard drive and color monitor is not
quite so ridiculous as Mr. Covert would have you think.

Back in Nov. '88, I purchased a 1040 STf and C-Lab's NOTATOR/
CREATOR software and have been real happy with both. Flash 1.6
and NOTATOR are the only programs run on the beast, although I
plan to add a word processor at some point. In general, I'm
of the humble opinion that NOTATOR has to be the finest music
software I've used. I use it to compose in real-time (i.e.,
without pencil and paper). When there are about 20K-events in the
event list, however, the graphic note display updates at an
annoyingly slow rate.
Would anyone who has used Turbo ST with the NOTATOR software
care to comment on their experiences? Would you recommend it?
Please e-mail and I'll summarize for the net.
Thanks.

>What could be the problem?
>...My question(s). Any idea of what could have happened? Solution?

I own both an ST and a PClone witha 1.44 drive. Unlike the one you used, mine has no trouble at all reading/writing 720k formatted disks. Unlike 5.25" disks, there's no difference in track size between the two densities, just in track density and write current.

Probably the 1.44 drive is broken! But the other likely problem is that you screwed up the disk by swapping IBM-formatted disks on the ST. Remember that the ST uses disk serial numbers to determine media change. MSDOS disks don't have serial numbers. So swapping two MSDOS disks on an ST, without inserting an intermediate Atari-formatted disk, will make the ST think you've reinserted the same disk, and it'll use the old FAT info.

I format disks on the ST using IBMFMT, a freeware utility that writes MSDOS-formatted disks with the random serial number. TOS 1.4 does the same. Other formatters don't, and you should be careful not to confuse the ST serial number checker.

Cross-posted to: comp.sys.amiga,comp.sys.atari.st

A friend of mine owns both an Atari ST and an Amiga, and he would like to be able to talk UUCP with other machines over a modem. Is there a utility that runs on either platform that will support such a protocol? It doesn't have to be a public-domain program; he just wants to know if anything like this exists. Failing that, is there a version of Unix or Xenix that will run on the Amiga? (That's the sledgehammer solution.)

If you know of any thing that fits the bill, I'd appreciate the info. Please respond to me via electronic mail (at "bmc@sei.cmu.edu"), as I do not normally read this newsgroup.

I suppose you're wondering why POOLFIX3.PRG (posted under separate cover) is number 3.

It's my fault. It hasn't been my week.

I created the fix and posted it, but it was busted. I fixed it, and then busted it again. After each go-around, I posted the "fix" to Usenet, GEnie, and CompUServe. Boy, when I want to make a fool of myself, I don't do it in a small way.

But hey -- if Lexus can recall all their cars, and AT&T can go off the air for nine hours, I can mess up once (or twice) in my life, right? I know what this must do to my credibility, and I really am sorry it happened. I hope that this will not discourage people from actually USING poolfix now that it's available. The trouble, in each case, was in the installation part of the program, not the part which actually fixes the bug. The meat of the patch is robust (knock wood!).

So there you have it: my humble apology for the false alarms, and now the fix itself. Use it in good health.

Sure. And every virus programmer in the whole world would instantly buy a ST!

The idea as such is great, and I think it has been used. Wasn't it COMPAQ who created some kind of RAM BIOS for an AT clone? I don't know if it ever was avaiable on the market, but I remember reading something about it in the swedish magazine "Datavarlden".

BUT, there are viruses... A lot!

>the Usenet articles claiming that Atari could not afford to support the
>average hacker at the level they need. One of my points was that the
>more stuff went out via "unofficial" channels, the greater the chance
>of it being warped.

This is just another proof of the importance of written articles, that
will distributed as such, and not by word. _NOONE_ tries to tell his
friend a 200 page documentation file over the phone.
Just look at the Hitchhiker's guide to the BIOS. I know it's developers'
stuff, but I also know it's avaiable on most BBSs. No corrupt information,
perhaps a bit out of order, but that's Atari Corp.'s own fault. [:-)]

Even a two or three-page article won't be spread by re-typing, it will
most presumably be spread by sending the file further. It's the easiest
and most efficient way.
And as soon as it has left the people who has a modem and is circulating
"out there" it will BE COPIED FROM DISK TO DISK - not re-typed!

This is my experience. (as with the article about the STE from the
German ST Magazine -- it is spread further from USENET in Sweden, by
me further to a lot of people, then after a while it reached one of the
larger ST stores in Stockholm. A lot of thanks to Ralph Haglund for
translating to english!)

Of course, there will always be missunderstandings. There are a lot
of them, anyway, though Atari don't say anything. People claims that
you say that, and that, depending on the phase of the moon. Nothing
could be done about that, that's human nature!

>Hopefully, Atari can come up with some reasonable guidelines for
>professional developers so that the information they have may be freely
>shared with the hackers who want it.

I cannot say that I think Atari's latest step was an approchment. Isn't
it true, thats's it's now illegal to "disclose information"? Sounds
weird to me.

>In the meantime, I and other Atari engineers will do what we can to
>give out what information we can here on the nets, despite the fact
>that it gets more distorted the longer it's out there. Sigh.

Thank you.

--

NOTE: This is by no means intended as some kind of flame against
Ken B. or anyone else at Atari Corp. PERSONALLY. It is just
my humble (?) opinion!

I think you need Arcshell 2.1 (? 2.1?) you can get it by anonymous
ftp from sol.cs.ruu.nl [131.211.80.5], It seeems to work fine.

Curiously, I found after de-arcing some DVI stuff from terminator that
although the first so-many files had been de-arced OK, the rest came out
with 0 lengths! I don't know what happen to cause this, there wasn't any
write error message like the one you got in Arc 5.21b. This happened
with two DVI archives, I couldn't recreate the situation 'cos I deleted
them after de-arcing them (seemed like a good idea since ARC never
reported any error...). Any have any ideas?

From: aimd@castle.ed.ac.uk
Message-ID: <1738@castle.ed.ac.uk>
Source record: 244530

In article <90011904271714@masnet.uucp> sylvia.jumaga@canremote.uucp (SYLVIA JUMAGA) writes:

>The STE's run all old ST software, hmmm? How much are the STE's
>going for these days? Maybe sometime in the future...

Sorry, Sylvia, you saying that just reminded me of something...

The UK magazine ST Format hasn't been doing Atari any favours recently. Just before Christmas it and its sister mag Amiga Format printed the story about how the Amiga developers turned down Atari and went to Commodore and how the ST was 'put together in a hurry'. This was rather damaging to the ST's sales, I know many people went for an Amiga because of this story - especially since the Amiga now sells for the same price as the 520ST.

It then printed a feature on the STe which contained lengthy comments from major games writers who didn't find a good word to say about the machine, basically they didn't fancy writing code for the machine until it had sold a large number of units and the blitter was waste of time because it wasn't suited to games programming. This attitude is deplorable but to be expected from people who try and sell you 8-bit games with pretty graphics for 25 quid. (Why has the price of games never come down, software houses used to tell us they were expensive because the 16bit market was very small. Now they say it's because of the development work that goes into making rubbish games that sell because of a film license or arcade game conversions).

Next month iin Format there is an article describing how Atari UK were furious about the comments since the programmers had broken their non-disclosure agreements. They said something to the effect that developers were entitled to their opinion but should keep it to themselves. Atari also threatened to withdraw the machines, either from the developers or from the magazine editors (I'm not sure which). ST Format's defense was that another sister magazine (I think) New Computer Express, a weekly, had printed a favourable comment, from Jeff Minter if I remember correctly.

This month's edition contains a shock-horror news article entitled 'STe runs into trouble' because STOS won't work (Oh my god! Not STOS!). The guys who wrote STOS seem remarkably calm compared with the tone of the rest of the article, they will provide a patch and fix future releases. The article then goes on to quote a PD supplier who says he's discovered a 'moderate' failure rate. This isn't surprising, we all know that a lot of PD stuff comes with out guarantees and often contains hacks and particular routines dependant on some version of TOS ('course if we

could get proper documentation then perhaps these things would never happen...)

It'd be nice if ST Format would look at the good points of the machine rather than slagging it off all the time.

On a rather different note, Atari UK haven't distributed Tos 1.4 yet because off their priorities. What with the new machines and wha-not they just haven't found the time. How come Atari Corp managed to get them to people months ago. Secondly, why haven't we been told how much TOS 1.4 will cost. Thirdly, why am I talking to myself when I know no one from Atari UK ever reads this newsgroup. Fourthly, why does no one from Atari UK ever read this newsgroup?

Anyway, I just thought I give all the netters out there an idea of whats been happening over here. This letter is a mixture of my memory and stuff I read in magazines, as a result I can't guarantee the correctness of any of it.

Hokey cokey?

Here is a very important hint for the would-be developer.

TRY TO AVOID "DEVELOPING" FOR A GIVEN MACHINE. When designing software
and writing that initial version, try to keep things portable. In
other words, try to avoid relying on specific memory locations. (Remember
that the ST is NOT the c1-Mhz, 16K computer that the Atari 400 was - you
don't have to count bits and clock cycles like you used to.)

The point is, you should try to keep your software so that you can
easily move it to other machines. There are a number of reasons for
doing this:
1) If the computer you wrote it on doesn't do well in the
market you can easily move to one that is doing well.
2) The more machines you can move it to the larger your
market will be (ie. a program written for both the IBM
and the ST will have a slightly larger market than one
which is limited to one machine or the other.)
3) You can adapt as technology improves. (ie. move it to
an ATW or a Next if you think there is a market for it)

Some things to keep in mind for writing portable software:
1) Try to avoid machine specific or compiler specific
routines. That is, stick to K & R or ANSI C as much
as you can (or whatever the standards are for the

language you like).
2) Avoid specific memory locations whenever possible. This
is important as many of these locations may change between
versions of machines. If you rely on these locations you
may find your software no longer works on a new machine.
(ie. What may have been fine in TOS 1.0 or MS-DOS 2.1 may
no longer work in TOS 1.4 or MS-DOS 3.2.)
3) If you must have machine specific stuff (usually for reasons
of speed) try to keep it separate from the rest of the
code so that when you need to port to another machine
you only have to rewrite those sections rather than the
entire program.
4) Avoid hard-coding constants into your program. For example
if you want 15 lines to be the fixed length of some
editing program use a
#define MAX_LEN 15
or something similar rather than placing the number 15
through all your code. This will make things easier to
change when you move to another machine.

Case in point. I am currently developing a toolkit for working with
various data structures. (I'll post more on that in a month or two.)
One of my goals is that I will be able to port it to whatever machine
I find useful for a given task (Someday I hope to have my own small
business, consulting and writing custom systems. This could often
require changing machines to adapt to the customer.). Although I am
creating it on a 1040 ST using MWC, I am porting it to Minix-ST to ensure
Unix compatability. So far I haven't had to change a single line of code
between the two. If I continue in this trend I will be able to port
my toolkit to whatever machine I want (Next, ATW, Sun, MicroVax, etx.)
without too much trouble.

In conclusion (finally - sorry for the long length, it seemed justified
by some of the comments which have been coming up on the net on
occasion), by avoiding developing for any given machine you can keep
your programs flexible, alowing them to be moved to whatever
environment seems useful for a given project.

While I realize that you often can't be 100% portable (especially if
you need fast graphics) you can often minimize the amount of machine
specific stuff to avoid limiting yourself to one specific machine.

682. Re: ST S/ware Rental Places

Newsgroup: comp.sys.atari.st
Date: 1990-01-20 22:56:04 UTC
From: gl8f@astsun8.astro.Virginia.EDU
Message-ID: <1990Jan20.225604.25167@murdoch.acc.Virginia.EDU>
Source record: 244534

This shouldn't be here, and it's my fault, but hopefully this,
er, discussion will end here.

In article <25910@brunix.UUCP> rjd@cs.brown.edu (Rob Demillo) writes:
[quoting me]
>>Needless to say, it's extremely rude to call some people pirates
>>because they rent software. Libraries rent books, video stores rent
>>movies. Video stores rent Nintendo carts, which contain software.
>>
>
>Sorry, Greg...I stand by my claim. And the Federal Trade Commission
>stands with me, I'm afraid. (As does STart, BYTE, PC Week, etc. They no longer
>accept advertising from software "rental" places.)

Not all software rental places are pirates. Libraries let you check
out software, are they pirates? Yes, *some* users rent software from
rental places to pirate it. Others don't. If I did rent from such places
(for example, I want to give Maple (costs $400) a test drive for a week
to see if I want to spend that much on it), I'd be extremely offended
if you called me a pirate. And you'd be wrong.

>Your analogies do not hold. If books were as easy to copy as software,
>you can bet there would be similar complaints.

Some books are easy to copy. One of my math textbooks cost $50, and
I could have photocopied it for $10. I guess you'd want the library
to not let me check out such books.

>Computer software is (currently) the *easiest* media to copy - and your
>copy is an *exact* duplicate, not some scratchy re-recording of a record.

Yes. That's why user education is so important. But the US was allegedly
a free country last time I checked, and there is no excuse to prohibit
legit activities.

>Frankly, Greg, I consider it *rude* to steal. I am a professional
>programmer, I work *hard* for my money.

So do I. Do you assume I think stealing is ok because I might want to
rent software? You're wrong.

> If you don't think piracy has wounded
>the software industry - look around.

I never said piracy hasn't hurt the software industry. I think it has.
But education of users is the key, not being rude to random people.

>Atari software, by the way, is acknowledged as being the hardest
>hit.

Please don't start this flamewar again. It was totally non-educational
last time around.

>>In short -- piracy is an issue you deal with by educating users, not
>>by insulting legitimate businesses.
>
>I agree completely.

Good.

> And don't believe I have insulted legitimate
>businesses. If you want to see a piece of software run, go to
>a store and ask the proprieter to start up a copy for you.

Here's where you're wrong. There are pieces of software for the ST that
I can't test in 20 minutes. If I want to demo a piece of MIDI software,
I want to take it home and play with it for several days. Some software
publishers put out demo versions of their software -- that's a great
help. But others do not. Here is a legit market for rentals.

Don't forget the old saw about "Innocent until proven guilty." If
renting software was only used for piracy, I'd think it was a bad
thing. But renting software is useful for legitimate purposes. And I
don't want to get called a pirate because I say renting can be ok.

Have a nice day, but don't tread on me.

> fuzzier than the one in my office. Before I start asking the dealer about this,
> as this is already a replacement for the faulty one first supplied, I thought
> I'd ask "Is there any way of adjusting the beam focus inside the unit?"

Sure, there's a focus knob located inside (labelled "focus"). In my experience, 5 out of 6 SM124's arrive slightly or substantially misfocused, and can be improved by adjustment. Be aware though that optimum focus can not be obtained simultaneously over the entire screen. I.e., if the center is perfect, the edges won't be, and vice-versa. You'll have to compromise, but it'll almost always be better than you started with.

Also, be aware that there are dangerously high voltages inside, so you can kill yourself if you're careless. You may also void your warranty. And be careful when you remove the back, since there's a rather short wire to the speaker that you'll have to detach.

Cross-posted to: comp.sys.atari.st,comp.sys.mac

the following is from the january 15 1990 issue of macintosh news

atari tt: threat to iicx?

late this month, atari corp. will begin shipping its under-$2000, 16mhz, 68030-powered tt computer. priced at about one-third of apple's price for the iix and iicx, this second-generation atari machine could be a threat to macintosh markets with the addition of the $300 gcr macintosh rom adapter from gadgets by small.

equipped witht he gcr cartridge and borrowed mac se roms, the tt will be able to run the vast majority of macintosh software at a fraction of apple's mac iix and iicx pricing.

still, atari is not well know for successful u.s. distribution. indeed, while the tt laboured through fcc testing in december, it was shipping in volume in europe. there, the machine is already a favorite of german industry and could impact mac sales in a country that is already below other european companies in per capita mac sales. stateside, atari's lackluster distribution could make the tt little more than a 68030 curiosity. it's pricedat three to four times the average atari 68000-based st system. by selling the t, storefront resellers will put pressure on their already limited resources.

I have a question that may seem naive to most of you, but I am now a freshman at the University of Miami, and this is my first time ever using a large computer network, in this case, a VAX system.

I read this newsgroup using the VAX NEWS command.

I have a question about FTP'ing. It seems that I cannot login to most so called 'anonymous' ftp sites while using the VAX system, but my friend on a unix system can get in fine.

Is there anything I can do about this?

Also is there anyone willing to help me get aquainted with this kind of system?

Like for example, what is UUCP? I just have a ton of questions, but I dont want to fill up the net with them.

Thanks for all help.

Message-ID: <3@gadgets.UUCP>
Source record: 244527

Fairly soon, the next Gadgets by Small newsletter will be going out. If you haven't registered your Spectre 128 or GCR with us, now is the time; there's talk of even including a free 2.5 update with the newsletter (can't guarentee that, though). Still, it's fairly good stuff.

If you have registered, our last newsletter went out last summer. If you missed it then, time to call and check. Or email me; this net address is unstable sometimes, I recommend the Well. (hplabs!well!dsmall, or dsmall@well.sf.ca.us).

Details of some of the good things upcoming are within, and it's free, if you just let us know your address, to our owners that register.

-- thanks, Dave / Gadgets by Small

p.s. I mention this because many people feel registration cards are near worthless, and never hear anything from the companies that they send them into; we're not that way. So far, we've given two free software updates, three newsletters, and lots of good karma to people who've sent in their cards.

From: rick@jhunix.HCF.JHU.EDU
Message-ID: <4006@jhunix.HCF.JHU.EDU>
Source record: 244536

Just a thought (as I know little to nothing about GDOS):

Why can't the equivalent of Apple's Font/DA Mover be made to create and edit GDOS ASSIGN.SYS files? That way fonts could essentially be loaded and unloaded just like on a mac, with relative mouse-ease? For that matter, desktop accessories could be copied/deleted/renamed with convenience and ease (heck, why not AUTO folder programs, too?).

I don't know GDOS from a hole in the wall, but I'd encourage anyone else interested in the project to take it on.

693. Spectre in Europe: colour and printing queries

Newsgroup: comp.sys.atari.st
Date: 1990-01-21 17:23:42 UTC
From: jmg@cernvax.cern.ch
Message-ID: <1210@cernvax.UUCP>
Source record: 244537

Two questions: Firstly, has it been shown that Spectre/GCR can work on a European system with a colour monitor? My attempts with a UK and a French system fail miserably. Secondly, any recommendations for a 24-pin printer driver (for a NEC P2200)? I have seen various ones mentioned, including Grappler LQ (but that seems to have a cable for a real Mac).

As I understand it, a lot of (yuck) PC-makers do this due to RAM-chips
having less accesstime than ROM-chips. It's called shadow ROM or
something like that.

699. Info on new BBS program coming out...

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 01:27:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9001220129.AA15116@jade.berkeley.edu>
Source record: 244543

Hey guys, I want to let you guys know of a new BBS program on
the block. I've been on the user end of it for the past 8 months
and the two programer who have been working on have finialy gotten
it into shape. I can now recomend it from the user end, and from
the brief glimpes, from the operator end as well.

They are offering a deal of the BBS program, Psaved from GFA 3.0, for
$39 beta version or delayed oering of the final version for $49.
(I dont recomend the later since i have no idea when they will finish it.)

Anyway, here is their speal, and if interested give their BBS a call and
check it out for yourself.

Stuart Carter : WANTED!
University Of Louisville : A job for this would be Astronomer at
Physics Dept. : some nice University.

_____Cut here_____

<<<<<<< STark BBS >>>>>>>

"Look it up, its just beyond ultimate, and just short of
unbelievable."

Are you tired of the same old BBS program that is never
updated or has less support than your Atari 8-bit? We were tired
of that also. Due to the STs lack of a good BBS program, we have
devolped what we think is the ultimate in Bulletin Board
Programming.

The following is a _short_ list of features offered in STark,
take the time to read them and compare it to your current
software, we are sure you will find STark has more features.
After comparing the features, compare the price.

STark provides the simplest way to set up the most complex
BBS. Included with STark is a fully GEM oriented "System Editor"
which takes you, step by step, through every corner of setting up
your BBS. After you exit the System Editor, you can run STark
without further delay.

STark has been designed to allow the Sysop the most power
user interface, while remaning totally user friendly. STark is
designed to best fit your needs, not some programmer who doesn't
even support the software any more. With STark you have over 100
different prompts, which can be edited to your needs. Unlike
other software, a STark prompt can be more than one line long.

If you ever ran Express you probably remember the variable tags. For those of you who didn't, a variable tag is a certain string placed in your text file that the BBS will replace with another string (For example, the users name). With Express you had access to 32 variable tags (Give or take one), with STark you have access to hundreds of variable tags. STark also has "Pre-Formatted" variable tags, which we have not the time to explain in such a simple explanation.

Menu Processing is very simple with STark. Any time STark loads a text file, it checks to see if it is a "Menu" file. A menu file is a file the Sysop sets up to do certain things, like maybe a database. Menu processing also allows you to set access levels for text files, or even make them not abort when a user hits "^C."

Any STark prompt file, text file, or menu processed file can be edited with any text editor, or word processor. You may even edit them with STarks built-in text editor.

STark uses "Command Tables" where you can set up your own menus, to do what you want. There are three "Command Tables" in STark, one for the main menu, one for the file areas, and one for the message bases. You can define up to 64 keypresses in each command table. For each separate entry (192 total) you can define the keypress, access level, procedure (Or text file/program), and a reaction. The keypress is the key the user hits to access this feature. The procedure is what tells the BBS what to do (i.e. Page Sysop, log off, etc.). This field can also be a text file or a program (Online game) you want executed with the associated keypress. The reaction is displayed after the user hits the appropriate key. This allows for great flexibility, you can have text files, online games, menu file, or anything run from your main menu.

STark can handle up to 256 message bases, each base may have up to 512 messages. The sysop is at liberty to define the maximum number of lines you can put in a message, but of course STark allows for extended messages up to 1,000 lines long. STark allows the Sysop to set a user up as a "SigOp," where the user would have total access to one base, and none to another. You can set each users access different in each base. STark, also supports the following message base features:

o Quickscan o Auto-QuickScan
o Verbose Messages o String Searching
o Threading o To/From Searching

STark can have up to 256 file areas. Each area can handle over 32,000 files. A little quick math tells you you'll never have TOO many files for STark. STark supports all of the latest features you expect, like VIEW ARC online, VIEW LZH online and VIEW ZIP online. You may also ARC files online, take files from

ARCHIVEs, and do almost any other ARCHIVING tool with ARC or the popular LZH method. STark Supports Xmodem CHK, Xmodem CRC, Xmodem 1-k, Ymodem Batch, Ymodem-G, Fmodem Batch, and, of course, Ascii (Zmodem is under developement). Like in the message bases, you can set up each users access different in each file area. STark allows the Sysop to assure good uploads by use of a Upload/Download ratio (Optional) or a Byte ratio (Optional).

The Sysop mode of STark is a dream come true. The features go far beyond any other BBS we have yet to see (For any computer). You have every DOS command at your fingertips, plus a full line of user editing features, batch file executions, etc. You can even call up a GEM mode which allows you to use your desk accessories, and pull up a fileselector box (Great for those nifty alternate fileselectors).

The features of STark are limitless, it offers Command Stacking, Hotkeys, Pre-Formatted Inputs, and much more. STark even has a built in "AUTO-BACKUP" feature which gives you the assurance of knowing your important files are always safe.

To get a good look at STark call one of our support BBSs, better yet call both and get a look at how different they can be (You'll ask yourself if its the same software).

700. ST Technical Questions

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 03:03:36 UTC
From: barry@gpu.utcs.utoronto.ca
Message-ID: <1990Jan22.030336.7741@gpu.utcs.utoronto.ca>
Source record: 244544

Hello,
I have several questions about programming on the ST that I can not answer with my current documentation. I am asking all of these at once in the hope that it will reduce network load. For the same reason, please respond to me rather than the net, and I will summarize and post if there is some interest. If you must use followup, please don't include the whole note to answer one question and help those guys (like me) who are using modems.

For reference, here are some possibly relevant background facts. I am using an Atari Mega ST4 with an attached SH204 hard drive and a SF314 external disk (in addition to the internal one). It has a standard SC1224 colour monitor. The GEMDOS Sversion() call returns 0x1300, and I am using Lattice C for development. The MENU+ appears to be at the 1.1 level, and the compiler reports version 3.03. The desktop info box doesn't have a version listed, but it does have a copyright notice for 1986 and 1987.

1. I have a program which builds object trees dynamically. It seems to have problems when the tree gets more than ten (10) levels deep. That is, the number of objects within objects within ... gets to ten. The objc_draw() call bombs if I ask it to draw the whole thing, and objc_find() stops at the tenth level, even though there are offspring objects which are selectable. Is this a design limitation? The mentioned routines would have to specially check for this limit, as anything modelled after Tim Oren's map_tree() wouldn't do this.

2. While playing around with Mr. Oren's "New Form Manager", I noticed that as the program gets more complex, it becomes easier to crash it by moving the mouse around quickly. I presume that the rectangle waits are falling behind the action and some internal event queue is getting overloaded. Is there any way to overcome this? I shudder to think of the effort involved in handling all of the Ikbd interrupts myself. Has anyone done this sort of thing?

3. When I select a command from the MENU+ window, I frequently get a blank text screen with nothing happening. I discovered that the application appears to be waiting for an interrupt or something, because if I move the mouse even a little bit, the program takes off. I would write this off as a MENU+ bug, except that I have occasionally seen this happen with the desktop when selecting a program to run. Has anyone else seen this one?

4. Speaking of the desktop, I have noticed that the mouse position for closing a window is very picky. I suppose that you wouldn't want the window to close accidently, but this is silly. I have even managed to get the close box to invert (selected), but not have the window close. Could this be a hardware problem?

5. There was mention of a "Pexec cookbook" a while back. Could someone please send me the reference to that?

6. I see a number of neighbours submitting to the net. Where do you folks go for Atari service and documentation in Toronto? Is TOS 1.4 available here? I am also having fun finding most of the popular "hacker's" books. It is largely hit and miss, mostly miss. I have found some of the Abacus books and the third COMPUTE Technical Reference (TOS). I would love to get the first two.

7. My hard disk quite often develops an annoying buzzing sound, like mosquitos are trapped inside. Tapping the box makes it go away (for a short while), but I don't like moving a running hard disk. Is there some component which needs to be glued down inside?

8. I borrowed a 1040 STf a few weeks ago. I noticed that it was noticeably slower than the Mega, especially for following mouse events. It was particularly bad for a game I wrote which does a lot of blitting, even when the blitter was turned off with the desktop menu on the Mega. It is the same processor, isn't it?

9. Is there an editor which emulates either MacWrite or EDT out there? I am not much of an Emacs fan.

I am working on a graphically oriented multitasking system, mostly for my own edification. I would be interested in conversing with others who have either done this sort of thing or who have ideas.

On the note of marketing, a Toronto radio station is giving Portfolios away as a prize for one of their contests.

Thanks in advance,

Barry Lay

702. Getting C

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 05:13:00 UTC
From: STJLHI33@wooster.BITNET
Message-ID: <9001250807.AA00731@ucbvax.Berkeley.EDU>
Source record: 244546

The recent discussions on gcc, g++ and sozoban have been very interested. I have been wanting to learn C for the last year or so but didn't have the $$ for Laser or MWC. Of course none of the ST mags would mention the pd/sware stuff... Anyway, sozoban seems like something I could use.

Uh-oh, problem. Panarthea seems busted from our site. Short requests, index, etc. are ok but not long ones, such as (wouldn't you know it) sozobon partxx.

Would some kind soul be willing to email me a copy? See .sig for address. Perhaps I'll finally be able to try my favorite crashing techniques in C!

Thanks*1.0E6

Jason Steiner STJLHI33@WOOSTER.BITNET

Prediction: Atari will release the ATW in the US no sooner than one month after Apple releases a RISC based multiprocessor box and lots of hype.

Guess which company has been buying huge lots of 88000s recently?

703. Re: ST Technical Questions

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 07:17:53 UTC
From: barry@gpu.utcs.utoronto.ca
Message-ID: <1990Jan22.071753.17009@gpu.utcs.utoronto.ca>
Source record: 244547

Hello,
I forgot a few questions when I posted the first note.

10. I have an application which tracks the mouse cursor in and out of a window by doing a rectangle wait for the window work area in addition to the standard message wait. I trap the various messages which move or change the window to keep the rectangle in the right place. With more than one window on the screen, I trap the WM_TOP message to set the new rectangle. However, closing a window doesn't seem to send a WM_TOP message for the newly active window. I can disable the rectangle wait on window close, but I would really like to find the new window and do it right. Does anybody have an answer for this?

11. I got my ST second hand, and I am probably missing some documentation. What does the "install application" function do, and how do I use it? I had the impression that I could change the application that would automatically launch if I double-clicked on a non-program file, but I can't get it to do anything.

12. What sort of fonts can I load with the vst_load_fonts() call? Is this a GDOS question (whatever that is)?

Thanks again.

Barry Lay

Hello,

jmrosset@hpgnd.HP.COM (Jean-Michel ROSSET) writes:

>Is there any implementation of smalltalk-80 or smalltalk V available on
>the Atari-ST ? I've heard there is an implementation of Little smalltalk,
>but this one has not the graphical capabilities of the real smalltalk
>environments.

There is a Smalltalk 80 available for the Atari ST.
It's a portation of the Parc Place Smalltalk, and I think the newest
version is 2.34, it is compatible to the Smalltalk 80 portations for
Sun (image portability). In Germany you can get this version from

Georg Heeg (georg@unido.UUCP)
in Dortmund.

I bought this version. In the next weeks you can get the new version
2.5 for the Atari ST.

You need:
Atari ST with more than 2.5 MB RAM
Harddisk with more than 10 MB of free disk space
Atari or compatible mouse with 2 or 3 buttons
(I'm using a quick bus mouse with 3 buttons).

with best wishes
Waldi

707. Modula-2 query

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 12:23:25 UTC
From: gge@cxa.daresbury.ac.UK
Message-ID: <24048.9001221223@cxa.daresbury.ac.uk>
Source record: 244550

This is a question for any Modula-2 wizards:

I am trying to code an extensible data structure in Modula-2. I have a working structure in (say) module A and would like to code an extension in module B, but (and this is the difficult bit) I would like to be able to use the procedures from module A as if they had been declared in module B (got that?). I have figured out one way:

```
IMPLEMENTATION MODULE B
IMPORT A
.
.
.
PROCEDURE Fred;
BEGIN
A.Fred;
END Fred;
```

However this is inelegant and negates any benefits gained from using modules in the first place.

Anybody got any other ideas?

Many thanks in advance
Gareth J.Baker

708. Question on use of Interleaves

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 15:35:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9001221812.AA24021@jade.berkeley.edu>
Source record: 244401

I have a question on Interleave. When formating a disk, which interleave
should be used for best responce time. (Or combination of interleaves)
The only infomation i have on the subject is "Use 1 for interleave" and
that is a bit skimpy for my taste.
I suppose i should also ask, how do you detect which interleave is
your disks current format? Some method of timeing the reading of sectors?

Message-ID: <PORTUESI.90Jan22155334@tweezers.esd.sgi.com>
Source record: 244402

>>>>> On 16 Jan 90 02:58:17 GMT, kbad@atari.UUCP (Ken Badertscher) said:

ken> Believe me, Arion, it's very very tempting at times. Especially when
ken> you see some of the really silly things that some developers do to
ken> break the rules. You want to punish them. But in fact, the end users
ken> are punished worse if Atari breaks programs which break the rules.

I disagree. In the end, the users are punished worse if Atari
doesn't break programs which break the rules. Those programs keep
Atari from adding bug fixes and enhancements to their operating
system, which hurts everyone in the end -- not just those people who
depend on broken software.

ken> All
ken> a user knows is that his favorite program doesn't work any more. If
ken> the company that made it is no longer in business, that user is really
ken> up the creek.

True. But in many cases, the user may be able to switch to an
alternative which didn't break the rules. And if I had some very
important piece of software I depended on for my livelihood, I would
think long and hard about migrating to something else if the company
that produced it went out of business.

>
> Is there anything I can do about this?

I can't answer your question about UUCP, but I can speak from experience about FTP'ing from a VAX/VMS system. Your system is converting everything to upper-case (I dunno why it was set up that way), and the system you are trying to connect to is case-sensitive (probably a Unix(TM) system). What works for me is to put quotation marks around anything the remote system is going to see.

e.g. FTP some.site.name
status message from the FTP program here...it should eventually tell you it connected, and give you the prompt.
FTP>login "anonymous"
message saying guest login OK, asking you for your user name as password
Password: your user name here (needn't be quoted)

If all goes well, it should tell you that you are logged in; it will probably say that some access restrictions apply.

In general, you will have to quote filenames or directories; you _probably_ don't have to quote commands (cd,get,dir,set,etc.).

Hope this helps!

-Max J

711. Mac ROMS

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 16:56:07 UTC
From: cciolori@telesci.UUCP
Message-ID: <938@telesci.UUCP>
Source record: 244404

Perhaps this is a silly question, but I will ask it anyway.

Everyone knows that the ST can mimic the Mac with the right hardware, software, and of course the Mac ROMS.
In addition, a message had been posted which indicated that the new TT machine would allow the ST to run Mac software at high speed, which could give apple some stiff competition if Atari took advantage of this, and made the public aware that this software/hardware exists.
A great ad campaign would tell potential buyers that the Atari, in addition to running its own software, could also run IBM, and Mac stuff too!

....then I got to thinking...let's say that Atari did begin take advantage of this oppurtunity, and in fact were hurting Mac II sales. Couldn't Apple just say FORGET IT and NO LONGER SELL anyone Mac ROMs? Or would it be more profitable to allow Atarians to continue to buy them? I mean, they are making money when people buy them, although I am sure they would rather be selling THIER computers along with them.
Just a thought...what does everyone think?
Chris

713. TOS io redirection bugs

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 17:37:21 UTC
From: dal@syntel.mn.org
Message-ID: <1990Jan22.173721.12285@stag.UUCP>
Source record: 244406

[neil@cs.hw.ac.uk (Neil Forsyth) writes...]
> I may be getting TOS 1.4 soon (though don't hold your breath folks:-).
> TOS 1.4 has the I/O redirection handling bugs fixed so you can redirect the
> output from any program. But developers have to use 'isatty' stuff so that
> their programs work on 1.0 and 1.2 so there is not really a big win here for
> them. Likewise with Malloc.

Allan's message about bugs with multiple processes having the same file
open (which is the root of at least some of the redirection bugs) clearly
said that this bugs exists IN ALL TOS VERSIONS. This includes TOS 1.4.
And I've verified that redirection bugs DO still exists in TOS 1.4.

The IS good news, however. By exploiting a "feature" of the Pexec()
mechanism relating to the h-blank vector, we seem to have a robust
work-around for most of the redirection problems. This technique has
been in use only for a week or so, but it does appear to allow nested
redirections of stdin/stdout, which enables programs like uucp mail
software to operate via chained "pipes" (really temporary files).
We've tested the new code with a calling sequence like...
uuxqt -> rmail -> lmail -> rmail -> uux
...where each process is invoked from it's parent via popen(), and thus
receives data via redirection stdin. This kind of calling sequence will
fail miserably using normal Fdup/Fforce redirection.

I'd be willing to post the technique to the net, but I would like to get
confirmation from Allan or Ken that the "Pexec/H-blank trick" will continue
to work in future TOS versions.

On a related point, there has been some movement to correct a long-standing
inconvenience in TOS regarding stderr. Handle 2 is connected to the AUX
port by default, but I support it's use as a redirectable stderr. To
force this to work properly, C start-up code should check to see if handle
2 is a tty. If is IS, then Fforce() it to -1 to attach it to the console.
This is harmless if it already IS attached to the console, and makes sure
you don't confuse your serial i/o device if it's still attached to AUX.
If handle 2 IS NOT a tty, leave it alone, since that should indicated that
someone has redirected it.

Being the person who wrote most of the MWC examples (other than most of the
GEM examples, which were mostly written by a non-programmer), I would like
to defend the MWC manual/examples a little here.

In article <1540@cs.rit.edu>, ajy2208%ritcv@cs.rit.edu writes:
> In article <10665@stag.math.lsa.umich.edu> hyc@math.lsa.umich.edu (Howard Chu) writes:
> [...informative stuff deleted...]

> This was a problem at first, as I am a beginning ST programmer and
> am not a registered developer (yet.. :-). Of course, the people
> who wrote the MWC documentation didn't bother mentioning the
> fact that the memory has to be ALIGNED.. But they provided a nice
> example, in which they aligned the memory, so that's how I learned..

Sorry about that... The decision to not put the restriction into the
main part of the documentation was made because it was unclear what
future products might offer. There was supposed to be a note that stated
that the current 520 and 1040ST machines had this restriction, but this
got left out by accident, and nobody seems to have noticed. The examples
had most of their comments stripped out so they could fit into the manual.

> >If you're writing code that you eventually hope for
> >other people to use, don't hard-code magic numbers like 32K into your
> >screen manipulation routines. [In fact, don't even use 32K. You only
> >need, at most, 32256, to get 32000 bytes on a 256 byte boundary, eh?]
> Kind of interesting, that the example in the MWC manual does have
> 32K hard wired in. Of course, it's only an example, but for someone
> learning how to do something for a first time, it's not setting a
> GOOD example.. sigh.. (at least it does have LOTS of examples)..

Well -- I had to use some value when I wrote the example. I could have
used a #define, but at the time it seemed like this would remain unchanged
for the immediate future, and we didn't want to go through all the extra
trouble (in the example) to calculate the memory needs of the new display.
(It was not a GEM example, and S.A.L.A.D. was not yet written, and even when
these two conditions are met, it is still more than a few lines of code
to figure this out in the general case for all possible future display
modes, if its possible at all. I don't know what happens when you use
a Moniterm.) These examples were supposed to be short and illustrate
proper use of the documented routine/function/feature, without adding
lots of extra stuff that might confuse or intimidate the novice ST programmer.

I might add that for a program like a picture viewer (as described in the
original posting) to work with the overscan modification a simple file
read / physbase change will not do the trick anyway. Most of these

bitmap graphics file formats assume the standard ST screen layout.

The fact is that at the time the MWC manual was written, there was very little programming documentation available for the ST. We went above and beyond the required material for just using our compiler and set a standard for completness which far outstripped anything available to the general public at the time, and which the competition took a long time to catch up with. We did not just rehash the material in the developers documentation, we wrote new documentation and provided examples for just about every Atari specific function in the system. We gave notes on how some BIOS/XBIOS/GEMDOS functions were documented to work in the developers documentation but actually worked in some other way and warned that these things may change. We went out of our way not to use any non-sanctioned hooks into the OS to make our product work.

In my honest opinion, biased as it may be, the MWC manual is the single best volume for programming the ST published to date. It needs revision, bugfixing, and maybe some other tweeking (new GEM examples, etc.) and the compiler should be updated, but it is still a very good package at a good price.

I don't work for MWC anymore, and don't speak for them. I've just seen a few people bash the MWC package recently and wanted to set the record a little straighter. I know that the posting to which I've followed up is not a bash, but it was a convenient place to put this.

> derived from pcc. The source and machine language debuggers work well.
> Steve J.

The MWC compiler is not derived from PCC. It is derived from the Coherent
(A 7th-edition Unix compatible OS with NO unix source code involved) compiler
which had been ported from the PDP-11 to the 8086 and Z8001 before the 68000
port was done. The compiler base is similar to pcc in many respects, but
it is not a derivitive of that compiler.

A large part of the speed "problems" that the MWC compiler has is because of
this history. A version (built from the same sources) ran on a PDP-11 as
a cross compiler until version 3. The PDP-11 has only 64k of virtual
address space. The compiler, therefore, uses disk files to store intermediate
code and chains between programs to do various stages of compilation.
The advantage to this is that the MWC compiler can run effectively in systems
with limited memory (512k with DAs loaded) and can handle programs larger than
available memory. I've linked an 800k program on a 520 with MWC.

Not a comment on rentals, directly, but not all local dealers are as helpful as indicated above. While we are lucky enough to have one here, and even though I am quite a good customer (ie I try to support him buy buying hardware and software from him), when I asked to see a demo of a program that he had for sale to see if it was worth the money, he told me that he'd be glad to let me try it out on his machines IF I PURCHASED IT FIRST! In other words, I had to BUY it before I could demo it (and they have a no return policy on software except for defective disks, which they exchange). This was at our authorized Atari retailer--the other stores that sold Atari software solved the problem nicely by not having any Ataris around at all, so that you also had to buy it before trying it out.

Don Allison
don@col.hp.com

(It seems he was having trouble selling packages that weren't shrink-wrapped, and hadn't bought a machine to re-shrink-wrap the stuff yet.)

730. Atari TT: Threat to IIcx?

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 19:58:38 UTC
From: hendrick@fozzy.UUCP
Message-ID: <840@fozzy.UUCP>
Source record: 244423

As a loyal ST'er, I wanted to pass along the following:
What follows is a quote from Macintosh News, January 15 1990,
"The Mac's Factor" by Rick Doherty (page 13)...

--- Begin quote ---

ATARI TT: THREAT TO IIcx?

Late this month, Atari Corp. will begin shipping
its under-$2000, 16MHz, 68030-powered TT computer.
Priced at about one-third of Apple's price for the
IIx and IIcx, this second-generation Atari machine
could be a threat to Macintosh markets with the
addition of the $300 GCR Macintosh ROM adapter from
Gadgets By Small.

Equipped with the GCR cartridge and borrowed
Mac SE ROMs, the TT will be able to run the vast
majority of Macintosh software at a fraction of
Apple's Mac IIx and IIcx pricing.

Still, Atari is not well known for successful
U.S. distribution. Indeed, while the TT labored
through FCC testing in December, it was shipping
in volume in Europe. There, the machine is
already a favorite of German industry and could
impact Mac sales in a country that is already
below other European companies in per capita
Mac sales. Stateside, Atari's lackluster distri-
bution could make the TT little more than a
68030 curiosity. It's priced at three to four times
the average Atari 68000-based ST system. By
selling the T, storefront resellers will put pres-
sure on their already limited resources.

--- End quote ---

Regards,
Bill

>I'm having a problem with the MAS assembler that comes with Turbo C v1.1. The
> [etc]

Please don't flame me.

I came across this posting in the atari.st newsgroup. Is the compiler being discussed here actually Borland's Turbo C? Is is some other company using the name "Turbo"? I am an Amiga owner and I sure wish Borland would market there compilers for the Amiga (In fact Borland advertised Turbo Pascal in the first issue of AmigaWorld but never delivered!). Anyway, if this IS the Borland Turbo Products, please inform me:

Which Borland compilers are available For ST's? C? Pascal? etc..

How much do they cost?

Are they considered good ST compilers?

Any comments on the product/support/marketing/etc?

Thank you.

>rental places to pirate it. Others don't. If I did rent from such places
>(for example, I want to give Maple (costs $400) a test drive for a week
>to see if I want to spend that much on it), I'd be extremely offended
>if you called me a pirate. And you'd be wrong.
>

OK, Greg...you're a great guy. You'll *never* "borrow" software,
then copy it for yourself to keep. I'll accept that.

My accepting that fact from you is a *far* cry from condoning a
place taht "rents" software. For every "great guy" like you, I
would bet there is (at a bare minimum) one other person who wouldn't
think twice about stealing software. Those aren't terribly
good odds for a software rental place, are they?

You know, in almost every environment I've been in, I've
heard excuses for why people steal software: "It's easy,"
"It's too expensive," "I just wanted to test it out."

Now you want to give these people a legit license to walk out of
a place with software that they have no intention of ever buying?

>>Your analogies do not hold. If books were as easy to copy as software,
>>you can bet there would be similar complaints.
>
>Some books are easy to copy. One of my math textbooks cost $50, and
>I could have photocopied it for $10.

Cheap != Easy. How long would it take you to photocopy
the book? The same length of time it takes to copy a disk? I doubt it.

> I guess you'd want the library to not let me check out such books.

Oh, please....

>
>>Computer software is (currently) the *easiest* media to copy - and your
>>copy is an *exact* duplicate, not some scratchy re-recording of a record.
>
>Yes. That's why user education is so important. But the US was allegedly
>a free country last time I checked, and there is no excuse to prohibit
>legit activities.

Again: oh, please. Don't give me that crap - that's right out of
a bad movie. The US is a free country, huh? Try walking down the
street naked. Want to test your right of free speech? Try yelling
"Fire!" in a crowded movie theater. There are limits to your freedom.
Software rental places should be among those limits.

>I never said piracy hasn't hurt the software industry. I think it has.
>But education of users is the key, not being rude to random people.

You sound like Nancy Reagan. "Just say no." It has nothing to do
about educating people. Some people are just *criminals.* They don't
bother to think about software piracy, because its so "easy," and
why not?

I do, can, will not, understand this tendency by the public and the
media to group software piracy into its own, special little category.
It's theft. Period. Just like stealing a car - 'cept easier. Why make
it easier?

You want to test out the product? Do it in the store. If you want to
"test it out" for several days, that's several days worth of use you
have placed on the product. If you are going to do that, why not
send away for a products' demo copy? If its a large package, they
are sure to have something, if its a small package - you're just
out of luck, aren't you?

>
>Don't forget the old saw about "Innocent until proven guilty." If
>renting software was only used for piracy, I'd think it was a bad
>thing. But renting software is useful for legitimate purposes. And I
>don't want to get called a pirate because I say renting can be ok.

I think it *has* been proven guilty. No one is calling *you* specifically
a pirate...but, as I said earlier, because you're a great guy, doesn't
me you can claim that software rental places haven't hurt the software
market...

735. Overscan stuff

Newsgroup: comp.sys.atari.st
Date: 1990-01-22 21:01:29 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <10712@stag.math.lsa.umich.edu>
Source record: 244428

(From a private message...)
%There seem to be a lot of details to consider:
%
%- what is the best hw mod? A local guy has a version which flips
% between overscan and normal under control of an unused pin in the
% sound chip (it may be another chip, my memory is unreliable).
This sounds likely, but I'm not sure how useful it'd be. I think having the definite control that a physical switch gives makes me feel a bit more secure overall... But it also sounds convenient in some respects. If you can post more details about it, I'd be interested.
%
%- how much software works, how much breaks? I have seen that the
% vt52 screen used by .tos programs fails to scroll properly unless
% you patch TOS or have a blitter. Perhaps TurboST or QuickST could
% fix this problem.
Ah, that's what I thought. Yeah, this scrolling problem is quite a hassle. You can also see it in TOS 1.2 ROMs (like I had when I bought my Mega. I think it's just the blitter code that's at fault. Also had this problem with older versions of TurboST.)

I've found, much to my dismay, that the GEM VDI function vro_copyform (and the corresponding Line-A function) clips at 640x400. This has been kind of a pain; I suspect that there are more functions with this limitation. Perhaps a newer version of the overscan software has been written with the appropriate patches, I don't know.
%
%- How well does it work with colour in North America (I had heard of
% problems).
It only works if the display is set to 50 Hz. I originally wrote a two line program to set this and stuck it into my AUTO folder. This was somewhat unsatisfactory, so I disassembled the overscan program and made the changes in there.
%
%- can it be done to the STe?
Wish I could get my hands on an STe. Oh well...
%
%- is the screen readable? I have a hard enough time reading "hi50"
% text on my screen, even with the monitor tweaked to shrink the
% boarders. "hi60" must be worse.
I guess this is pretty subjective. I occasionally have a problem such that the scan rate is off. The symptom is that the screen is shifted left or right by about 6 pixels. Toggling the overscan switch back and forth clears the problem. I like the "hi50/hi60" mode, I don't find it

particularly hard to read, and it makes editing source code that much
easier (more context onscreen).
%
%- does Spectre support this mode?
I don't have Spectre either. Not being much of a Mac afficionado these
days, I doubt I ever will...
%
%I think that your experiences with overscan are worth describing in
%the st newsgroup. This note is to encourage you to keep it up. If
%you can answer my questions, I recommend posting the reply to the net.
%
%Hugh Redelmeier
%{utcsri, yunexus, uunet!attcan, utzoo, hcr}!redvax!hugh
%When all else fails: hugh@csri.toronto.edu
%+1 416 482-8253

Well. There 'tis.

I've got a question I hope someone can answer... As I mentioned above,
the raster operations don't seem to work on rasters larger than the
standard 640x400 or 640x200. I had to write my own code to replace the
VDI calls in Uniterm to get some of the screen manipulation working.
Just now I encountered something that's got me really perplexed. I
copy the entire screen from the current logbase to an alternate buffer,
redraw stuff on the screen, then sometime later copy the entire buffer
back to the current logbase. In the meantime, to hide the fact that
this copy is occurring, I setscreen so the physical & logical screens
are pointed at the alternate buffer. This is just fine, the picture
looks perfect. But, when the original buffer is restored, the top row
of pixels is either scrambled or slightly offset (I haven't figured
out exactly what just yet...). The same routine
is used to do both copies, only the source and destination addresses
are swapped. I can't understand why the exact same routine copying
the exact same data winds up with not-the-exact-same result... ?

I basically agree with your other statements, but I just wanted to
note that I *have* had requests to see software turned down in a number
of stores- B&C Computervisions in Sunnyvale as an example. One of the
reasons I don't shop there...I am lucky enough to have access to several
stores in the area, but other users aren't as lucky. Under those
circumstances, software rental places could serve a legitimate function.

Fine. So don't say that *every* place that rents software should be
run out of business because of the actions of a few.

That's all I ask. I won't respond to the rest of your posting because
it was a rehash of old arguments, except for this:

>You want to test out the product? Do it in the store. If you want to
>"test it out" for several days, that's several days worth of use you
>have placed on the product. If you are going to do that, why not
>send away for a products' demo copy? If its a large package, they
>are sure to have something, if its a small package - you're just
>out of luck, aren't you?

Not all products have demo versions. Maple does not, it is a large
package, and it costs large amounts of money. It's stupid to tell
me I cannot demo Maple for several days in my own home just because
you're scared I'll steal it. If a friend had Maple and were willing
to lend it to me for a few days I bet you'd think that was bad
too?

>...but, as I said earlier, because you're a great guy, doesn't
>me you can claim that software rental places haven't hurt the software
>market...

I never said that. I said software rental as a concept is not bad, and
that while some software rental places are pirate havens, it is not
necessarily true that all are.

I hope this discussion ends here. We are repeating ourselves, and you
are missing my point.

743. Megamax C questions

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 01:57:46 UTC
From: wright@asc.SINet.SLB.COM
Message-ID: <9001230157.AA05784@ascsu1.SLCS.SLB.COM>
Source record: 244437

Here's my first attempt at a posting....

For three years I've been using Megamax C and then Laser C. I've accumulated the bugs described below, several of which cost me many hours to track down. I sent a letter (U.S. Mail) last September 24 saying what I've said here, but haven't heard anything back from Megamax. My questions are:

Does anyone know if or when Megamax intends to fix these or any other bugs?

If I switch to MWC (or some other C) can I expect similar headaches?

1. Pointer arithmetic

This problem has been there since one of the old Megamax C releases. It prohibits pointer arithmetic on pointers to arrays longer than 32K bytes.

2. Compiler crash on static initialization
In LaserC v1.0, the compiler didn't crash, but it allocated too few bytes of storage (one).

3. OR operation on register long
This one appeared on changing from v2.0 to v2.1.

```
main()
{
register struct xyz
{
int p1;
int p2;
} *struct_ptr;
register int i;
register long j;

/* uncomment the following line and compiler crashes*/
/* static char compiler_crash[4] = {1}; */

/* following uses 16 bit addition when 32 is appropriate*/
struct_ptr += i;

/* following won't change j */
j |= i + 1;

}
```

These are my opinions, not my employers'.

745. TT. More rumours?

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 07:17:00 UTC
From: BALTUCH@BINAH.CC.BRANDEIS.EDU
Message-ID: <9001240802.AA00950@ucbvax.Berkeley.EDU>
Source record: 244439

Somebody was quoting "Macintosh News" about the TT starting to ship States side
"late this month... for under $2000" I don't know but mac news could
be just as gifted a rumour mill as as any. Besides the "under $2000"
noun clause seems so ridiculous... Wouldn't such a price threaten Mega
sales? (Notice the question mark? It's just a question ok? I didn't graduate
from Harvard Business School) Any source closer to Atari would care to
comment? I mean, late this month can't be later than within 7 days,
so if this has any substance to it, at least dealers should know by now.

Jacob

747. Arcgsh - current state of development

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 07:56:20 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <1913@laura.UUCP>
Source record: 244442
Cross-posted to: comp.sys.atari.st,dnet.atari,sub.sys.st,unido.atari

Now that Arc 6.02 is out it is time for a new version of Arcgsh. (For those who do not know about Arcgsh: It is a GEM program which allows you to call archivers like Arc and Zoo (and other programs) comfortably using dialog boxes. You do not have to remember all those single-letter commands and those even more cryptic options but simply select them from dialog boxes where they are noted *with* their meaning.)

Those of you who have tried to call Arc 6.02 from Arcgsh will have noticed that it results in two bombs. Mea culpa. I did not set up the xArg environment right. This problem never popped up yet because Arc 6.02 is the first program I called from Arcgsh that supports xArg. (Zoo claims it supports xArg but it does not.)

The fix was quite easy but I think I take the opportunity to fix some other things, too. And then the additional functionality of Arc 6.02 has to incorporated into the user interface. These are all more or less trivial things but - considering my spare time - will take some time.

Whoever of you (registered or unregistered user) needs Arcgsh *desperatly* to work together with Arc 6.02 may get the current intermediate release, just drop me a note. Else wait for the official release in comp.binaries.atari.st.

(Still missing: Sources for Arc 6.02 to get it to work on the UNIX machines.)

>are (not properly) daisy-chained?

There is only one 'motor on' control line from the ST, which goes to
both the drives. Many drives will turn the motor on on receipt of a
'motor on' signal, even if they are not currently selected.
(Previously, I would have said 'all drives', because I've never seen
one that didn't, but sounds like there must be some.) The theory seems
to have to do with (a) allows a disk driver to spin the disk up before
selecting it, and (b) means that if you are copying from one disk to
the other, both can be left spinning which will be faster than having
to keep bringing one or the other back up to speed.

Sounds, though, like there is some manufacturer's mech which has its
internal logic set so that it will ignore 'motor on' unless the drive
is selected.

It is possible to connect a 1084 to a 1040. The only thing you need is a
cable with a Scart connector for the 1084 and a monitor plug for the ST.

750. MWC malloc and Malloc

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 14:05:22 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1229@lzsc.ATT.COM>
Source record: 244444

I previously mentioned that the size of each Malloc can be
adjusted in MWC so that repeated calls to malloc won't run
out of memory. Here is a code fragment from STEVIE.

```
bool_t
readfile(fname,fromp,nochangename)
char *fname;
LPTR *fromp;
bool_t nochangename; /* if TRUE, don't change the Filename */
{

/* HERE IS THE MAGIC PARAMETER */
extern long _aclicksize; /* malloc granularity */
struct stat xstat;
long l;

if(stat(fixname(fname),&xstat) < 0) {
fprintf(stderr,"Cannot open %s ???\n",fixname(fname));
}
/* xstat contains the info on the file fname */
l = xstat.st_size/_aclicksize;
if( l > 32) {
_aclicksize = (_aclicksize /32) * l ;
}
}
---------
In this program only this module does malloc() calls.
Thus by guaranteeing that there will be no more than 32 Malloc() calls to
TOS all is well.

> that is a bit skimpy for my taste.
> I suppose i should also ask, how do you detect which interleave is
> your disks current format? Some method of timeing the reading of sectors?
>

The information with the Adaptec 4000 controller that most MFM systems
use is to use interleave=1. There are 17 sectors on each track. With
an interleave of 1, all 17 are used. Any other interleave, they only use 16
of the sectors. So, you immediately get more capacity by using 1.
There is (I believe) some caching in the Adaptec 4000, so for typical accesses
there seems little degredation.

My recollection of running ratehd is that my MFM drives came out around 300KB/s.

From: mike@system.Cambridge.NCR.COM
Message-ID: <563@system.Cambridge.NCR.COM>
Source record: 244446

My son needs some help with a routine he is writing. He is much more familiar with GEM programming than I am. The ST is considered HIS at our house. Anyway, he has a question and I have the net access. Any help you can give will be appreciated. Send replies to me, and I will make sure he gets the info.

By the way, I believe that he is using Personal Pascal for this project if that makes a difference. He does speak C for other things so don't let the language stand in the way.

Me, I get to do Unix(tm) at work ... lucky me ???

thanks,

mike

------------------------from Joe---

I've been working on a little (okay, NOT so little) workaround.
This essentially involves the rewriting of the AES form_do() routine to allow for text objects to have wraparound text entry. Unfortunately, I need to use the AES routine objc_edit(). The problem? Incredible lack of adequate documentation.

Does anybody have any idea how to properly make use of objc_edit()? I would _really_ appreciate an example of this function used in working code. Any assistance whatsoever would be useful. Send any comments or code segments to the net address above.

> >anybody know if this is true ? I would hate it if there wouldn't be an
> >ANSI version of MWC.
>
> Steven W. Klassen +----------------------------+

I called MWC a couple of months ago to report a bug problem (which turned out not to be a bug after all :-)) and asked about an ANSI version of the MWC ST C compiler. I was told then that the programmer who wrote the ST was a contractor who went on to bigger and better theings. Then, I was asked if I wanted to write the ANSI compiler!

Well, I turned them down, and haven't anything since. But, seeing as MWC started selling source code to their Libraries in 1989, it seems that they need whatever profit they can derive from the ST market, even if it means selling source code. If things get much worse, they might even sell source code to the compiler itself!! (that's just a joke folks!!)

But, I am not surprised that MWC hasn't produced an ANSI C compiler, or even a C++ compiler for the ST market. After all, it appears that Turbo C has the German ST market all wrapped up, and the German ST market is the ONLY healthy market left for the ST. The US market has died and gone to MacHeaven or to PCHell or wherever!!

All this is not to say that I don't like the MWC compiler. I still use it and buy the updates whenever they are sold. I currently use version 3.09. But, I am considering getting GCC as it is more ANSI compatible and I can get source code to it!! (GCC is the GNU C compiler and has been ported to the ST).

As far as the TT goes, who knows if we will ever see it in the USA, so who can tell if MWC will support it.

Good luck folks!

Seconded. Whenever I'm writing GEM code, the first thing I look in
is the MW manual. If I can't find it there, I look in the HitchHiker's
Guide, or somewhere else. But I can usually find it in MW. It's
really good.

From: depeche@quiche.cs.mcgill.ca
Message-ID: <2027@calvin.cs.mcgill.ca>
Source record: 244450

I asked this question a little while ago and got some responses from
people who had good intentions but not enough facts about how to solve
the problem...

How hard could it be to get a program to send all its output to
the a file or the printer WITHOUT changing the screen output?

i.e. I'd like to direct output to a file but I also want to see what it
is on the screen, so I can run interactive programs and save all the output.

This would be easy if there was a shell which supported pipes, but contrary
to popular belief, GULAM does not support such, and neither does
mwc shell (it simply redirects the output of one program until it is
finished, and then runs the second taking the file it created before
and redirects the input of it to this file.) A real pipe needs multitasking,
I guess.

Do standard output calls use a system call to print characters on the screen?
if so , perhaps changing the vector for that call to another routine
which first sends the character to the printer and then calls the
original system call would do the trick.

I am a novice in this area of system programming - I only know the theory.
Has anyone actually done something like this?

> second issue), which discussed a novel way of writing
> to the cartridge port; basically, it involved having
> some decode logic in the cartridge which took an
> address read by the user program, and turn it into
> an outgoing data byte.

I wrote the article in question. If you want to add something like a
'LS138 decoder to a few of the higher address lines, then you can do
what you want. reading from addresses FB00xx writes device '0' with data
xx (note the simplification in my design - the data is actually offset
by one bit since A0 doesn't exist on the cart. I later found out that
-UDS can be used as A0). Addresses FB01xx could then access device '1'
etc. The '138 will decode 3 address lines to 8 chip selects (0-7).
If you need more, cascade them or use 4 to 16 line decoders, etc.

Unfortunately, I can reach neither of the writers from here. I think
the information may be of interest to other hackers on the net, so I
am posting the reply and suggesting further discussion take place here
for the benefit of all.

Oops! I forgot to patch two bytes in the relocation area. I hate those last minute patches before the program is even out to the net. Here is the correct(ed) patch:

```
---------------------- cut here ----------------------

#include <osbind.h>

main()
{
int fd;
short patch_area[16];
char ch;

if((fd = Fopen("temacs",2)) < 0) return(1);
Fseek(232092L, fd, 0);
Fread(fd, 28, patch_area+1);
if(patch_area[1] == 0x40E7) {
Cconws("Patch #1 already applied\r\n");
goto patch_2;
}
patch_area[0] = 0x40E7;
patch_area[15] = 0x4E77;
Fseek(-28L, fd, 1);
Fwrite(fd, 32, patch_area);
Cconws("Patch #1 applied\r\n");

patch_2:
Fseek(380732L, fd, 0);
Fread(fd, 1, &ch);
if(ch != 0x08) {
Cconws("Patch #2 already applied\r\n");
return(0);
}
Fseek(-1L, fd, 1);
ch = 0x0A;
Fwrite(fd, 1, &ch);
Fseek(+3L, fd, 1);
ch = 0x10;
Fwrite(fd, 1, &ch);
Cconws("Patch #2 applied\r\n");

Fclose(fd);
return(0);
}

759. problems with GNU-Emacs termcap file (sample file included)

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 18:51:56 UTC
From: roeder@sbsvax.cs.uni-sb.de
Message-ID: <2370@sbsvax.cs.uni-sb.de>
Source record: 244367

Some people reported problems with termcap. If your termcap-file (example file
included below) is for example D:\bin\etc\termcap.gnu, you have to set the
following environment:
setenv TERM atari
setenv TERMCAP /dev/D/bin/etc/termcap.gnu
If you have edited the file with another editor, the file may contain ^M 's
as additional end-of-line delimiters. Please remove these. Emacs recognizes
termcap-entries iff only linefeed is the line-delimiter.
Another problem comes from some zoo-programs changing '-' in filenames to '_'.
Before trying to dump emacs, watch out for such files and change the names
back.

- Edgar

> to death.
Not beaten to death recently, I think.
I've built three 60 MB drives using the BMS-200 kits from E. Arthur Brown.
EABCo sells the BMS host adapter, case, and power supply...you buy the
drive elsewhere. I bought ST-277N drives from Hard Drives International
(they advertise in Computer Shopper and Byte).
It takes less than an hour to put the drive together and install it, if
you follow EABCo's somewhat sparse instructions correctly. Construction
consists of attaching the DMA cable, a ribbon cable, two power supply
connectors, and mounting the drive and host adapter in the case. The
BMS software has a nice boot-holdoff feature that waits until the drive
spins up before starting the boot process, so you don't have to power up
the drive and ST separately. Other than that, the BMS software is pretty
basic. There's a battery-backed clock on the host adapter which can be
read from a program in the auto folder. Some considerations:
1. The cost of everything plus shipping is much cheaper than comparable
drives from Supra or Atari, but there are other options, such as ICD
and Toad Systems, which are in the same price range as BMS.
2. Two of the drives worked fine the first time, but a third had a flakey hard
drive which sort of worked for a few weeks, then died. HDI replaced it,
but I found arranging the replacement very annoying. Calling HDI's
support line seems to involve a mandatory wait of 20-30 minutes on hold,
and it isn't an 800 number. It also took them a month to come up with
a replacement, compared to two days to ship the original. In contrast,
both EABCo and BMS were very helpful and responsive in diagnosing the
problem.
3. The BMS software is very basic, limited to 4 partitions @ 16 MB. The
EABCo version simplifies the BMS package by supplying special setup
programs for Seagate SCSI drives ONLY; they omit "confusing" information
about setting up other types of drives. If you want to use another brand
of drive, you should buy the BMS-200 directly from BMS. BMS suggests using
Atari's hard disk software if you want bigger or more partitions...
apparently they aren't planning to support those options anytime soon.
4. With the EABCo setup, there is a spare power supply connection. You should
be able to add a second SCSI hard drive for the price of the drive, a
SCSI ribbon cable, and a second case (no room in the first case due to
the host adapter). How you could get the power and SCSI cables to the

second drive is left as an exercise for the ambitious.
The main advantage of the SCSI solution is ease of upgrade. You can buy a small SCSI drive and replace it with a big one later, and you have a good chance of selling the original in the pc/mac marketplace. I think that the BMS system from EABCo is a reasonable choice, particularly if you enjoy tinkering, but check out ICD and Toad options as well.
Good luck,
Don Rice

The speed problem can be minimized through the use of the ram-disk
(if you have the memory for it - ie. at least a 1040). A very nice
ram disk is included in the MWC package. The 'disk' files used for
intermediate code and stuff are then written in the ram disk, ie. almost
as fast as using main memory directly (there may be some overhead in
the maintenance of the ram disk but it likely isn't too bad). Multiple
passes through the data is very slow on a disk but not bad at all on
a ram disk.

I must admit, however, that I haven't made any comparisons between
compile speed of different compilers. I consider that issue to
be of lower priority than run speed (ie. I will put up with slower
compile times if I get better run times as a result.).

>
> You know, in almost every environment I've been in, I've
> heard excuses for why people steal software: "It's easy,"
> "It's too expensive," "I just wanted to test it out."

And, if you can't find a legitimate business that rents software and you intend to make an illegal copy you will find an individual. Or, if all else fails you will go in with a friend and buy "a copy to share".

I, for one, am sick of buying stuff that doesn't work. For example, I bought Publishing Partner back in the old days. The first upgrade means that it sort-of worked. I then bought a PageStream upgrade that broke in the first 5 minutes. The story continues.

After much wasted time and money, a friend "loaned" me a copy of Ventura Publisher. I worked with it for a week - time enough to learn about it and find out that it does what I need to do and does it properly. So, I bought it.

I have a copy of PC-Write. It is ShareWare. I do most of my text entry on UNIX but if I decide to do some on DOS using PC-Write I will "buy" it. Why? Because I have had a chance to test it out and it does what I want for a fair price.

> Now you want to give these people a legit license to walk out of
> a place with software that they have no intention of ever buying?

Probably because software manufactures don't offer the correct alternative - a 30 day return policy. Raima corporation offered such a policy. I evaluated their product and decided not to use it. The result is that I can say very nice things about it. It did what it was supposed to do but not what I wanted. If I had been stuck with it I would be telling everyone what a bad product it is.

I purchased an evaluation copy of Progress. It did what I wanted and I bought the real copy. I have been using it for about 3 years and they have made close to $10,000 off of me. If it hadn't been for the $99

elvaluation copy I am sure I would have never bought the product.

My point is that there are two kinds of people: the ones that swipe software and the ones that pay for what they use. It is too bad that those of us who are willing to pay for what we use become the victims of marketing plans that attempt to prevent software theft. The theft will continue anyway.

I can rent a Ford to see if that is the kind of car that I want to drive. I can "try out" a job before I agree to work somewhere for the next 5 years and/or the rest of my life. I expect the same with regard to my purchase of software. Yes, I know it is easier to swipe but that isn't my problem. Maybe if vendors would offer a little added value with the purchase, like decent support, people would understand the advantage of purchase.

767. How to Fix a Dead ST???

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 21:38:03 UTC
From: don@col.hp.com
Message-ID: <370005@col.hp.com>
Source record: 244360

How do you go about maintaining your Atari ST? I managed to kill mine in the process of upgrading the memory (it was flakey anyway, but it is really dead now--when you turn it on, the color screen flashes a random color, the speaker clicks with the power on, and that's it...no disk access, no bombs, nothing!) I returned it to it's original 520 ST state, and it is still dead. Using a scope and the two drawings that came with the developer's package, I've about decided that the MMU is bad, since it appears that it is not driving the enables of the 373's and 244's on the data bus, but I'm not sure. My question is, how do others get theirs fixed if and when they break? My temporary solution was to get another one while I was working on this one, but I need to get this one working again since I want to use the 4 Meg upgrade kit I have (and I don't want to have TWO dead ST's on my hands!).

Our local dealer and "authorized service center" knows less about electronics than I do, and I think his test fixture requires the system to at least boot before it can diagnose anything--and besides, I heard on the radio this morning that his shopping center is being gutted by fire right now and everything there is a total loss. Does Atari still have it's repair/exchange program? If so, does anyone know how to get in touch with someone there to start the process? If not, does anyone have any ideas on what might be wrong or how I can get it fixed? I'd hate to have to just toss it (although I had one salesman tell me that the machines were good for about 3-4 years before they died a permanent death, and this one is about that old).

Help!

Thanks,
Don Allison
don@col.hp.com
HP Colorado Springs Division

(Sorry to bother everyone, but I haven't had much luck lately playing phone tag with Atari, and my last email message there disappeared into the ether--besides, I'm hoping someone else had this problem already and found a fix for it! Email me and I will summarize if I learn anything useful. Thanks again!)

768. Tape Backup of Hard Disc

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 22:09:02 UTC
From: alex@athertn.Atherton.COM
Message-ID: <17055@laurel.athertn.Atherton.COM>
Source record: 244361

I've just become aware of a Unix Style streaming tape backup system
that is available for the ST. It uses a cartridge tape mechanism
(Archive 5945, Wangtec, etc.) to back up your hard drive, via the
SCSI bus. This is _much_ more convenient than floppies. It currently
does file-only backups (sorry, no disc images).

If anyone is interested, e-mail me, and I'll point you to the source
of this stuff (I'm not affiliated with the company, and make no money--
just thought this would be useful info).

From: wallace@oldtmr.dec.com
Message-ID: <1439@engage.enet.dec.com>
Source record: 244364

A number people have responded to my original posting (about ARC 6.02 not working with the graphical ARC shells) by stating that the latest version of ARCSHELL (V2.1) works with ARC 6.02 (thanks). I concur, what still does not work is using UNARC, ARCGSH21 (different program than ARCSHELL), and older versions of ARCSHELL with ARC 6.02. I tend to use UNARC a lot as I usualy have a half a dozen or so arc files at a time to be de-arced. So it would nice if UNARC would work with ARC 6.02.

I'm also curious why ARC 6.02 causes these shells to bomb. They have survied other ARC version changes.

>In article 8371 of comp.sys.atari.st:
>RON SHARP writes
>.A part time developer has a choise: develop on a machine which has all
>the information available for $30 at any computer book store, or $300
>for a stack of photocopies from Atari.

Is the situation that bad on the other side?
We buy for example
"Das Grosse ATARI ST Profibuch" (editor SYBEX)
It will set you back more than $30 (90 mark or so) but it means
800 pages of solid information. (Ever heard of the "Deutsche
gruendlichkeit"). Not the way it should be or was meant, but how it
_is_, tested by German hackers. Unbelievable what they cram on just
one page.
The Dutch translation costs f100,- (dutch guilders). Has this 14M
country more Atari's than the english speaking world? I would think not.
I do not know the ISBN number of the German version, but here
is the ISBN number of the dutch version:
Jankowski, Reschke and Rabich
Het complete ATARI ST boek
ISBN 90-5160-152-2
If you do not want to learn Dutch or German, you may push for
a translation....

There is also a new book that is only about mass storage on the Atari,
I wonder whether the people at Atari would get the information
together in this form, if they tried. (Do not have the title etc.
at hand now)

Disclaimer : I am not affiliated with the autors or the editor,
just that one of my friends is mad about this book, that is (I admit)
even better than the 3 or 4 books about the ST I have.

773. questions on GDos and the Okimate 20, meg upgrade, and the Break key

Newsgroup: comp.sys.atari.st
Date: 1990-01-23 23:12:00 UTC
From: JOHNMAR@IITVAX.BITNET
Message-ID: <9001240807.AA01775@ucbvax.Berkeley.EDU>
Source record: 244366

I HAVE THREE PROBLEMS. FIRSTLY, I HAVE WORDUP BUT HAVE NO PRINTER DRIVER FOR GDOS FOR MY PRINTER, AN OKIMATE 20. I CAN USE A EIGHT PIN DRIVER BUT IT PRINTS OVER TWICE TO MAKE THE GRAPHICS. THE TEXT LOOKS BAD, BLOTCHY FOR SOME REASON AND PLUS THE RIBBON FOR MY PRINTER IS EXPENSIVE FOR AS LITTLE TEXT I CAN PRINT ON IT. IS THERE A GDOS DRIVER FOR MY PRINTER? I'D GET A NEW PRINTER IF I COULD AFFORD IT.

SECONDLY, I RESENTLY ATTEMPTED TO UPGRADE MY COMPUTER TO 1 MEG. IT FAILED. I'VE CHECKED ALL THE CONNECTIONS AND THEY SEEM FINE. I WAS WONDERING IF THERE WERE A WAY TO CHECK THE RAM CHIPS IN CIRCUIT. I'VE PIGGY BACKED THE CHIPS ON MY 520 ST WITHOUT SOCKETS (VERY SILLY). I'D BE VERY HAPPY IF I WOULDN'T HAVE TO UNSOLDER THEM. WILL BAD RAM REGESTER OR JUST APPEAR NOT TO BE THERE? I HAVE GOOD REASON TO BELIEVE SOME OF THE CHIPS MAY BE BAD; THEY WERE SHIPPED IN A BOX FULL OF STYROFOAM. ANY HELP WILL BE GREATLY APPRECIATED.

LASTLY, I HAVE A VERY BOTHERSOME PROBLEM. I HAVE ATTEMPTED TO HARDWIRE MY ST TO MY SCHOOL'S VAX. THAT WAS SUCCESSFUL (I THINK) BUT THE COMPUTER TAKES A [BREAK] TO LOGON. I HOOKED UP MY ROOMMATE'S IBM PC FINE AND IT WORKS BUT I DON'T HAVE A BREAK KEY! WHAT KEY COULD I PRESS TO BE EQUVALENT TO THE [BREAK] ON A PC? I'VE TRIED THE LONG AND SHORT BREAKS ON UNITERM BUT THEY DID NOT WORK. WHAT CAN I DO?

IF YOU CAN HELP PLEASE SEND HELP TO JOHNMAR@IITVAX.
THANX,
MARK W. JOHNSON

774. CAD programing on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 00:26:37 UTC
From: blee@plains.UUCP
Message-ID: <3179@plains.UUCP>
Source record: 244368

I am very hapy to see a professional CAD (Computer Aided Design) program released for the ST. BUT, As a colege student I am very disapointed in the price...sory Dyn*CAD But I am not rich.

Because of the price for a 'professional' level CAD program I have been wanting to write my own, also since I do not consider myself much more than an average programer I need help. I am looking for people that are also interested in such a project.

The program that I forsee, will concentrate on speed in this order
adition/subtraction of entities
screen redraws (same view angle, diferent window)
group moves
screen redraws (changing view angle)
printing

The people that I *think* that I need are:
*****> Atari machine code optimizers
Any one who has writen a 2/3D manipulation program--
outlined fonts come to mind
People who have worked with other CAD's file formats--
Probably a ways down the road
Math Co-processor programers
Anybody else!!

The target:
A high level ** 3D ** package, with the priority on speed/power rather than extra niceities ie. the UNIX of CAD.
A strait graphic interface.
A Open system--Source code, popular file formats...etc.
I am torn between Shareware and GNU's method of distribution...who knows?

I hope that including this extra info will invite a good response from all of you GREAT programers out there. Any one interested or that have had experience with this sort of program please contact me.

Anyone with experience/tips/CODE to contribute contact me soon.

Blaine Lee snail mail: 1012 So 8th St #18, Moorhead MN,56560

Source record: 244369

Without entering a slagging off session I must agree with what has been said about the british publication "ST Format" It has recently reviewed two ST progs with which I am reasonably familiar "Fleet St Publisher 3.0" and "Music DTP" by Take Control. Neither of these reviews were very complimentary and this would be O.K. if they deserved it however they do not. I must add at this point that I am not just jumping to the defence of my favourite progs, as I feel a great injustice has been done. It seems as if the reviewers spent 10 minuites with the programs not the days they deserve. In fact in the case of "Music DTP" they clearly did not understand the concept of the program and compared it with totally dissimilar ones.
Thus to those at the other side of the pond I request that if you judge British magazines by any one single publication then let it be ST World. This is a fine (but not totally flawless mag) but in comparison with the other "comics" it is unbeatable.

p.s. dont bother buying it for games coverage though as there isn't any!

This can never be any more than a personal opinion but it is one I hold with the deepest of conviction.

Any Flames (from ST Format probably)

>
>Looks like after Atari lose the US, Atari will lose the UK too!

Yup! It's beginning to look that way.

Some dealers are already dropping the ST.

Users are comparing the European ST shows with dire UK ones.

TOS 1.4 (well I needn't repeat myself :-)

Software houses are not bothering to bring out new versions of their ST
packages. (eg. Timeworks, Autoroute)
Their distributors don't tell anyone this. They get you to register your
product so that you will be informed of updates but there will never be any.
They just send you more flyers for new products.

Dave Small thinks Hi-Soft are a good company. We registered our Spectre 128 and
have yet to hear any word on software updates. It took two letters to get
information on upgrading to Spectre GCR and even then they had engineered
the cost to make it better to just buy the GCR. (The first letter yielded a
flyer!)

Those companies still producing ST software seem to be going off in the
wrong direction. (Calamus will NEVER have a Postscript driver I was told by a
Signa rep. Thus no-one here is remotely interested in it.)

Yup, these are sad times.

785. TOS 1.4 in the UK

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 12:00:15 UTC
From: mike@abekrd.UUCP
Message-ID: <824@abekrd.UUCP>
Source record: 244378

After all the fuss about TOS 1.4 we have seen absolutely nothing from
Atari UK - surprise :-).

I have been frothing at the mouth at the thought of all those improvements,
especially the ability to auto-load gem applications. This would allow
my non-computing friends to word-process or draw without having their
brains imploded trying to click on this and then that and then double-click
here..

The froth has dried and my lips are chapped -it's getting harder to say
'My computer would do that easier and quicker'

The latest 'news' is gossip in magazines saying that it will cost about
40 pounds (reproduction costs, Proms, distribution etc.). Meanwhile all
my AMIGA (wash your mouth out with soap, boy!) friends get WORKBENCH 1.4
for FREE as a cover disk!

Come on Atari! Follow the lead, stay ahead of the crowd. All that's needed
is a little patch program in an auto folder to load & execute the new TOS.
You could even give express permission to allow users, the luckier ones
with access to prom programmers, to blow their own proms. Or allow some
enterprising company to distrubute them for You, thereby relieving
Atari (UK) of the burden (and small profit) entirely.

We have constantly asked Atari to keep with the cutting edge. To a large
extent they HAVE done so (the ST is a superb machine & the TT promises even
more), now we ask you to keep faith with your customers and allow us to
maintain our enthusiasm and support our machine!

786. Wordplus File Format

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 13:03:22 UTC
From: hofer@urz.unibas.ch
Message-ID: <862*hofer@urz.unibas.ch>
Source record: 244379

I'm looking for the format of CFG and DOC files of Wordplus.
Does anybody out there have the information?
Could he post it to me?
Thanks in advance.

Remo Hofer <hofer@urz.unibas.ch>

P.S. I like ST Picture Formats List. Thanks to Dave Baggett.
I would like such a document for other files too (such as vectorgraphics,
textfiles etc).

787. STEVIE src

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 13:20:42 UTC

I have sent this request out before, but received NO REPLIES...

So I don't know if the message even got off the site. So I am sending
it again.

Does anyone have the source for STEVIE (vi like editor) if so, could
they please email it to me.

You can even reply to this just to let me know that it got off site
if you like.

Cheers,

As plausible as your suggestion sounds to the non-economics type person,
the fact is that Atari lost money as a result of the financial bath they
took with Federated and the money they lost on a lot of inventory they
had lying around. For a company as highly leveraged as Atari, these kinds
of mistakes often prove disasterous and/or fatal. I expected a bit more
from the brothers Traniel. I had expected them to get the stock up to
$15-$16 range, dump the company and take profits, and buy Miniscribe. :-)
Hehe, the first half of that sentence is serious, the last part is not.
<grin> Well, with these guys, who knows???

In article <1230@lzsc.ATT.COM>, hcj@lzsc.ATT.COM (HC Johnson) writes...
>The information with the Adaptec 4000 controller that most MFM systems
>use is to use interleave=1. There are 17 sectors on each track. With
>an interleave of 1, all 17 are used. Any other interleave, they only use 16
>of the sectors. So, you immediately get more capacity by using 1.

When I run ICD software with an Adaptec 4000 I get 17 sectors with interleave=1 and 18 sectors with any interleave other than 1. So contrary to the above you get more storage with interleave greater than 1. Possibly this varies depending on whose formatting software you use.

I've run RATEHD with the disk formatted with interleave at 1 and 2 with virtualy the same results in both cases. Of course the real test would be to run your applications on both formats and see if there is a difference in performance.

I concur with Howard that Adaptec reccomends using an interleave of 1. But if your application access the disk a block at a time and slowy at that then 1 may not be the optimum.

>ON A PC? I'VE TRIED THE LONG AND SHORT BREAKS ON UNITERM BUT THEY DID NOT WORK.
>WHAT CAN I DO?

Our AT&T requires a break also, UniTerm does just fine. The easiest way
to check if your connection works on the ST is to unhook the serial connector
for the briefest of time, thus sending a long break signal. Then hook it back
up and fire away. (That's what I did until I had UniTerm which can send a
break signal.)

BTW, is IIT Illinois Inistitue of Technology? If it is, do/did you know
Bernard Pontillo? (last I heard he was heavy into AI) Use lower case letters.

796. Re: VDI commands recording

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 17:25:38 UTC
From: greg@sj.ate.slb.com
Message-ID: <1990Jan24.172538.13937@sj.ate.slb.com>
Source record: 244389

Opinions expressed are the responsibility of the author.

In article <6351@sdcc6.ucsd.edu> cs163wed@sdcc10.ucsd.edu ( ) writes:
>Hello. I wonder if it is possible to add an overhead to the VDI
>such that calls to any VDI functions can be recorded automatically

>memory in some sutiable format. Afterwards a record can be
>replayed, saved to disk, loaded from disk, or whatever. This is
>kind of like the "picture" of the Mac OS quickdraw. Is this
>possible? Also, does anyone know the format of GEM metafiles
>(i.e, the format Easy Draw uses to store its drawings.)

It ought to be possible, but by no means easy. Since the VDI is entered via a "trap" instruction, you can write your own trap handler and insert it ahead of Atari's by saving the address of theirs and replacing it with the address of yours. (Alternatively, you could replace your compiler's binding with your own which intercepts these calls.)

Your handler needs to save all the pertinant data each time a VDI trap is taken; this would include the relevant array data (control, ptsin, etc.) and the contents of certain registers (I'd have to look up which one(s)). The specific locations used are documented in the Atari developer's docs. (You could save all of the arrays every time, but this is massive overkill, though it would simplify the code. However you only have to write the code once.)

In many cases you will need to intercept the *return* data, since you're interested in mouse events; you can arrange to return to your handler first (instead of directly to the application) in order to do this.

I think I'd put some kind of header on each "record" which the playback code would use to identify which call was trapped, and how much data was saved. Where to put it is determined by the function call in a similar manner to how it was saved.

Some potential problems I can see are arranging for sufficient buffer space to copy all of the data on open-ended calls like "v_pline()", where the number of points can be large. Of course, if you are just interested in mouse and keyboard events, then your task is simplified somewhat since you can simply pass-through a large number of graphics calls.

Still, I can see problems with event "playback". You'll probably need to create a desk accessory which would get the file name from the

user, and arrange to install your "driver". Your playback driver would have to trap certain VDI calls, just like the record driver, but instead of actually calling the VDI afterwards, it would load the saved data from the file into the appropriate places, and return to the application. I can see a lot of potential headaches here.

A much simpler way to do this would be to write a mouse and keyboard-event handler, which would record and playback these packets at a much lower level. However, this would not allow you to actually capture graphics calls. Not knowing your application, I'm not sure which is more appropriate for you.

This is an intriguing concept, and I welcome comments from other programmers on the feasability/infeasability of doing this.

First, thanks to everyone who replied to my request for information about Malloc() and malloc(). The net is a very valuable resource, and I challenge those who say there is no useful information to be found in this newsgroup!

In article <893@per2.UUCP> dag@per2.UUCP (Daniel A. Glasser) writes:
>Being the person who wrote most of the MWC examples (other than most of the
>GEM examples, which were mostly written by a non-programmer), I would like
>to defend the MWC manual/examples a little here.

After using the manual for 2 weeks now, I very much appreciate the many examples it offers. Especially after seeing Laser C's manual. I also like the Lexicon format of the manual, as opposed to having related functions grouped together (although that would be nice in ADDITION to the Lexicon, but that's what other books are for.. :-).

>Sorry about that... The decision to not put the restriction into the
>main part of the documentation was made because it was unclear what
>future products might offer. There was supposed to be a note that stated

>had most of their comments stripped out so they could fit into the manual.

No flame intended.. It just gets frustrating sometimes when something very simple keeps you held up all night when programming..

>[...]
>In my honest opinion, biased as it may be, the MWC manual is the single
>best volume for programming the ST published to date. It needs revision,
>bugfixing, and maybe some other tweeking (new GEM examples, etc.) and
>the compiler should be updated, but it is still a very good package at a
>good price.

Agreed. I am very satisfied with Mark Williams C. I have also used Laser C (at a friend's place), and am not all that impressed with it. It DOES compile significantly faster than MWC, but that is in part due to the fact that he is running everything from a ramdisk, while I am running everything straight from the hard drive. I need a memory upgrade, one megabyte doesn't seem to cut it anymore!

I had problems compiling a program on Laser C, and after I did get it to compile it bombed quite frequently. Well, I took the code over to my house, changed a thing or two (mainly some #include statements), and compiled it with MWC. To my surprise, the program ran flawlessly the first time. Hmmmmmm....

I also like MWC because it is more Unix-like than Laser, however the
Laser Source Debugger is quite nice, and a bit easier to use than the
MWC Source Debugger.

in article <1230@lzsc.ATT.COM>, hcj@lzsc.ATT.COM (HC Johnson) says:
> The information with the Adaptec 4000 controller that most MFM systems
> use is to use interleave=1. There are 17 sectors on each track. With
> an interleave of 1, all 17 are used. Any other interleave, they only use 16
> of the sectors. So, you immediately get more capacity by using 1.
> There is (I believe) some caching in the Adaptec 4000, so for typical accesses
> there seems little degredation.

Actually that is backwards. If you format an MFM drive using
an Adaptec 4000 or 4000A using a 1:1 interleave you can only have 17
sectors per track. If you format the drive with a 2:1 or higher
interleave you can get 18 sectors per track. As far as I know no ST
hard disk interfaces support the latter option (at least they didn't
the last time I checked, about 2 years ago), there are some Amiga
controllers that do support the 18 sectors per track mode.

The Adaptec 40xx series controllers are a very old design, they
actually predate most of the SCSI standards (at least the official dates
on the standards). This means they have some problems, for instance
they don't correctly identify themselves so programs can't tell if a
4000 (MFM) or 4070 (RLL) is being used. They also do not have any on
board cache memory.

> further than the first block, if at all).
> --

You might check your modem's "command wakeup" character. I had trouble
with an old SmartCat 1200 that used a single '%' as the switch to command
mode flag. Of course, every time the binary transfer contained something
that the modem interpreted as a '%', the modem would dutifully switch over
into command mode and do nothing more. The connection would then time out
and abort the transfer. Since I never used the % key in interactive mode,
I had not seen the problem before. Switching over to a Hayes clone that
required a much more complex "wakeup" sequence eliminated the problem.

From: david.schreiber@canremote.uucp
Message-ID: <90012422213594@masnet.uucp>
Source record: 244398

The problem is probably that Word Writer accepts the ASCII file but
the carriage returns stay in when you try to reformat, right? I'm afaird
that not only WW that does it. You have to strip out those hard CR's.
DCopy288 will do it.

From: david.schreiber@canremote.uucp
Message-ID: <90012422213611@masnet.uucp>
Source record: 244399

I gather that your problem is this - you import an ASCII file into
Word Writer and find that when you try to reformat, the carriage returns
get in the way. You can't get rid of the original 'hard' CR's. WW is not
the only program that has this problem. Word Perfect also has it, for
one. You have to strip out those CR's. You can do that by using
DCopy288. It has a command for stripping CR's. Let me know if this
solves all your prblems.

808. Hisoft's WERCS

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 21:13:10 UTC
From: covertr@force.UUCP
Message-ID: <483b9177.14a1f@force.UUCP>
Source record: 244451

I bought WERCS late in 1988 and haven't updated it since. Recently
I tried using it to create a resource file (.RSC) with about 10
different dialogue boxes with assorted text strings and buttons in them.
But, at random points in time, WERCS would corrupt the WERCS HRD file
containing the variable names given to each object. Thus, I have not been
able to finish my RSC file.

Could someone from Hisoft (who is I believe the original UK publisher
of WERCS) tell me what is the latest version number and release date
of WERCS? and tell me if Michtron, the USA distributor of WERCS, has
it?? If Michtron doesn't have the latest version of WERCS, could you tell
me how I, who lives in Arizona USA, can get the update. Heck, WERCS is
worth buying all over again if I could just get a working version!!

TIA

810. help: trying to mount ch3 modulator in 520

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 21:48:35 UTC
From: mwtilden@watmath.waterloo.edu
Message-ID: <33568@watmath.waterloo.edu>
Source record: 244453

I recently got two channel 3 modulators for my upgraded 520 st
from Atari. I was annoyed to find out that one of them had a
74ls86 (quad XOR) whereas the other did not. Both units also
had a two-cable wire coming out of it which gave no indication
as to where they were supposed to connect.

The questions are: which of these is the REAL 520 modulator, and
where the hell do those funny wires go? Mounting one at random produced
zero results and my Sams Computerfacts on the 520 are no help. Would
anyone who's had experience mounting these things please tell me the
obvious thing I'm missing.

Thanx.

Well... Remember how I was so happy about possibly getting these
"floptical" drives really cheaply if we got enough people?

In mail to people who responded to my original article, I told them
that this was not a done deal, and I hope that I implied it in my original
article... [I do not believe I explicitly stated it]

Today I received a reply from Brier Technology... They said that
the floppies will be $25 apiece...

However, they also said that they will not sell to us [a group
of 100 people I was assembling], because it wouldn't be "appropriate"
and we're not OEM customers. What a joke. It seems that if they allow OEM
customers to buy in lots as low as 100, they should allow a group of
individuals to buy 100 too..

NOT ALL hope is lost yet though... Just 1/2 the hope (heh heh)...
I still haven't received a reply from Insite, and they possibly will let
this deal go through.

If they don't, I guess I'll have to change my .signature!

Just wanted to keep everyone updated on the situation.
--
If you want info about a 20 meg "floptical" drive mail me. YOU CAN ALSO
GET ONE FOR --$440-- (NEW **LOWER** PRICE!) BY MAILING ME. [WE HAVE TO GET
ENOUGH PEOPLE THOUGH..Slightly higher for less people but not much]

<current "loud PC AT" 8-) rating.

... tonight I had the time to open my drive again. I used a fan made by MICRONEL AG, Tagelswangen/Z"urich, article no. F52AM Q12DN CK (12 V DC). The fan is nearly compatible to the original fan. It is slightly larger than that and thinner. But it still fits into the original box. I bought it from a computer shop in Berlin (by mail order). The people have advertised in the ST Magazin, I don't know how often since I read that magazine only occasionally. The original fan has a stronger flow of air but that proved not to be a problem over operation times of several hours in a warm room.

Message-ID: <900124224428.248715@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 244457

hi!

I am just putting two megas into a VAX/PDP11 tower. This frees the desk
of two boxes but the monitor cable (SM124) is too short. Any source or
suggestion for a replacement?

As far as I know, the original cable uses a 75 Ohm coaxial connection
for the video signal and 5 shielded leads for the rest. Is that true?

I think this topic may be of quite general interest . So I suggest a
discussion on the net.

Thanks!

816. Minix questions

Newsgroup: comp.sys.atari.st
Date: 1990-01-24 23:12:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900124231205.484243@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 244459

hi!

the minix newsgroup has split off from info-a16 quite a while ago with the consequence that most of the st users on the net lack information on the present state of that os. The nearly permanent discussion on multitasking on the st shows that there is wide spread interest in a cheap and working multitasking os (no replies like "why I don't need multitasking", please! no one is forced to use something different from tos). From that background i would like to ask if some of the Minix users might sum up their experience with the os...

a few additional questions:

- is virtual memory provided?

- how fast is the file system? Has anyone made comparisons with tos1.4? what time does, for example, gcc 1.34 need to compile and link a " hello world" program without optimisation? Under tos1.4 and a SH205 this time is 9 s, mostly disk io. (Fastload flag set, cache111 installed). Of course, the compilation must be the only user process in minix.

- how efficient is the task switching? (MX2/TOS1.2 needs 5-10% of the cpu time).

- how does minix compare in this respect to cumana os/9, the mt-c-shell?

- how many user processes can be run efficiently?

- is it possible do do graphics?

- does minix run with the hyperscreen mod?

- has a window oriented user interface been implemented (e.g. the bellcore window manager)?

- what shells are available? BASH? What other GNU stuff?

- what about the problems with the supra host adaptor mentioned a while ago? Was this a problem of hardware or of software? Or simply a user error?

- is it possible to read and write 82t/10s tos disks?

Thanks

Michael

>> good odds for a software rental place, are they?
>>
>My point is that there are two kinds of people: the ones that swipe
>software and the ones that pay for what they use. It is too bad that
>those of us who are willing to pay for what we use become the victims of
>marketing plans that attempt to prevent software theft. The theft will
>continue anyway.
>

Several of you (Phil, Greg) are missing my point. I am willing to
accept the premise that you two are honest. *No one* is accusing you
of being otherwise. If you borrow a friends software to test it out
fine. If you can talk a dealer into giving you a demo, fine. If you can
get a demo from the publisher, fine. I have done all three of these
things, either returning my copy if I didn't want it, or buying it
if I did.

However: software rental places are open inventations for all the
non-Gregs and non-Phils to easily copy (i.e. STEAL) software. If there
was a proliferation of software rental places, how long do you think
software manufactures would stay in business?

We recently succeeded in forcing (by various means) manufactures from
placing copy protection on non-game software. What do you think would
happen to that decision if software rental places were to suddenly
pop back into being?

>I can rent a Ford to see if that is the kind of car that I want to drive.
>I can "try out" a job before I agree to work somewhere for the next 5
>years and/or the rest of my life. I expect the same with regard to my
>purchase of software.

Again, these analogies do not hold! A car is a unique item that you
cannot instantly duplicate for pennies. Ford Motor Company is not putting
its neck out on a line by letting you test drive the car. Hell, if you
destroy it, the damn thing is insured. Lotus 1-2-3 does not have that
luxury.

I *can't* think of an analogous example because there *isn't* one.
The only one that comes close is in the record industry. When I was
going to college in the early 80's, there were several record rental
places within walking distance...over the years, I watched them
"mysteriously" disappear...finding out later that they were closed down
by the trade commission and the FBI for copyright infringements.

The same thing is happening to software rental places...there are several
rulings in court and for all I know they may already be illegal.

Software is *RISKY*, Period. It's risky for the manufacture and its
risky for the consumer. Both sides have to live with it or everyone
loses.

Phil...you complained about faulty ST software that you bought. You want
a reason for it? ST software companies don't make very much money because
they don't sell very much software. I know one of the original Publishing
Partner people...their estimate was that roughly more than half of the
Publishing Partners in circulation were (are) illegal. That translates
to a little less than $1 million in income. That's money that could have
been spent hiring more personnel for programming, testing, inquiries,
etc. They don't have the resources to put out IBM or Mac quality
products and packaging.

The percentages are not as high for other platform markets, but they are
dealing with so large a volume that they can make up for it, but it
will bite them later. 5 years ago I heard that Lotus estimated it was
losing $400 million a *year* to piracy.

My point is that piracy continues. Software rental places would
"legitimize" piracy in the minds of people who already think its
ok.

> Yes, I know it is easier to swipe but that isn't my
>problem.

Yes. It is.

> Maybe if vendors would offer a little added value with the
>purchase, like decent support, people would understand the advantage of
>purchase.

Read what I wrote above. ST software people cannot afford it. There
aren't that many ST platforms, and even that is being corrupted by
piracy. Support takes people, people take money, and money takes sales.

Hello/Bonjour/Hola/Gutentag:

I was up all last night trying to call a file selector using
assmebler code mixed with a C source file.

I am trying to send the extended information to the AES file
selector function that is picked up and utilized by LGF's File Selector.

In the documentation for the LGF FS, there is in-line assembler
code provided to type into a C program to get it to call the file selector.

One of the instructions is "bsr AES" ... Well, Laser C does
not seem to have any constant "AES" defined.

Does anyone know the absolute memory entry point for the AES?
Can anyone help? We'll see.

Thanks!!!!

It's called "Scheibenkleister II, Massenspeicher am ST". It's almost 900 pages of solid information about floppies, hard disks and related topics. Just the TOC is 16 pages, the index is 9 pages smallprint. Here's a short overview of the contents:

1. Basic information about mass storage, files, etc. (ca. 10 pages)
2. Files under GEMDOS (ca. 45 pages)
3. Structures on a floppy (ca. 35 pages)
4. Floppyprogramming using BIOS and XBIOS (ca. 45 pages)
5. FDC, DMA and the rest of the world (ca. 20 pages)
6. Recording mechanisms (ca. 25 pages)
7. The floppy controller (ca. 40 pages)
8. & 9. Description of the software supplied with the disk (ca. 70 pages)
10. Copy protection (ca. 25 pages)
11. Floppy hardware (ca. 45 pages)
12. Harddisks on the ST (ca. 25 pages)
13. The harddisk controller (ca. 50 pages)
14. Description of supplied HD software (ca. 70 pages)
15. More details about harddisks (ca. 40 pages)
16. Your own drivers in the BIOS (ca. 25 pages)
17. Infos about CD-ROMs (ca. 60 pages)
18. Finals (ca. 45 pages)

and

11 appendices summarizing everything in tables, schematics, etc (ca. 130 pages)

Apart from all the information, it is fun to read the book, since it is written in a very humourous (is that the correct word ?) style.

The book has the ISBN number 3-927065-00-5 and can be obtained from

MAXON Computer GmbH
Industriestr. 26
D-6236 Eschborn
West Germany
phone: I don't have it handy right now

Disclaimer: I am not affiliated with the authors or the editor, it's is just my most favourite book about the ST, since I love to play around with this stuff, especially harddisks.

Oh, and the price is around 60 German marks (as far as I remember).

Source record: 244472

Just two days ago, Joachim Vance gave a list of available anonymous ftp sites.
Most of these sites were situated in the US. What about Europe ?

P.S.: What does I.P. Address mean ? Are there interesting subdirecories at the
simtel20.army.mil milnet node ?

Please reply via EARN/BITNET: K298027@CZHRZU1A or in this conference.

Give them a little time, but they're trying hard. The way they're doing it is like this:

Atari UK markets the ST as a games machine, rather than as a programmer's, writer's, desktop publisher's (etc.) machine.

The Amiga is (let's face it folks) a BETTER games machine, which is now the same price as an ST and has lots of games software.

So the Amiga's now outselling the ST in the UK.

Easy, really.

Not in this part of Europe.

Even Atari UK's Bob Katz was saying the TT wouldn't be around until
Spring 1990, and he's usually on the optimistic side (to say the least).

Mind you, none of the Atari dealers where I live (Brighton, UK) will
stock it. 1040s are a bit 'high end' around here.

>I think so.

floptical - FLoppy OPTICAL

The 'floptical' is the magnetic read/write, optical positioning/clocking technology,
as opposed to the 'optical', which uses optical positioning/clocking and
optical read/write. Unless something has come along that I didn't notice,
(altogether possible) most 'flopticals' are 3.5" diskettes that look much like
the regular diskettes, but have optical positioning and clocking data written
onto one side, and hold anywhere from 10 to 30 megs or so.

Open Computer Shopper to almost any page you'll see adds like: 80386 - 20 MHz, 1MB RAM (up to 8MB), 200 Watt PS, Both 1.2 and 1.44 MB FDs, 68M HD (28ms), 14" SVGA Monitor with 512K-16 Bit VGA Card, MSDOS4.01 and GW BASIC, 1 Yr warranty (30 day money back guarantee) - $2495 (4MB system - $2740) (shipping extra) [Computer Shopper 2/90 - EPS Tech.]

My point is that whatever you think about MSDOS and Intel architectures, a TT product must be price competitive with these 386 systems. Besides, GEM was available for MSDOS systems even before the ST came out...

Yes, STWorld seems to be the best of the bunch for "serious" ST coverage.

I logon to a BBS (CIX, U.K. "equivalent" of BIX) which is quite heavily frequented by some of the STWorld journos and the editor and they seem to be quite knowledgeable, articulate and approachable.

I wrote a short product review for them and only one minor (clarification) change to my text was made.

I echo Don's happy words. I have both a BMS-100 (retired) and BMS-200.
The BMS-200 creates a real SCSI chain. I have 2 Adaptec 4000A and 1 SCSI
cartridge tape. All works well.

I previously mailed to those interested my own formatter and partitioner.
I wrote them to support simply my large drives. They support SUPRA partition-
ing (12/drive), large TOS of 32meg (tos 1.4 only).

I use my rewrite of the BMS driver which supports the SUPRA tools and adds
'mount' to allow changing the name of a drive. (That way the name stays the
same as partitioning is changed.)

I recommend BMS highly.

841. STE memory upgrade.

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 15:01:51 UTC
From: D.C.Halliday@newcastle.ac.uk
Message-ID: <1990Jan25.150151.28362@newcastle.ac.uk>
Source record: 244485

I am desperate to upgarade an STE's memory and have some questions. This Is a repost as I am not sure if the first post reached the net.

Question 1.

Are the SIMM modules in the STE of a standard type, as I have seen an ad for SIMM modules for these machines ...

Amstrad,AST,DELL,EPSON,EVEREX,HP,INTEL,IBM,SUN... etc of the following types.

```
Memory X bits Speed
---------------------------------
256Kx8 100ns or 80ns
256Kx9 100ns or 80ns or 60ns
1Mx8 100ns or 80ns or 70ns
1Mx9 100ns or 80ns or 70ns
4Mx8 80ns
4Mx9 80ns
```

So which of these are of use and how can I mix them?0I know the STE has four SIMM slots. I think the 520STE (yes ATARI UK are shipping a 520 version) has boards in 2 slots (is this 256Kx8 ?).

Question 2.

I have heard that the STE can access more memory than the ST. 8mb was quoted by a person at Third Coast. Is this correct or can it go higher say with four boards of 4Mx8 to give 16M ? Is this memory still accessed as two banks? So how does TOS 1.6 access its memory?

>
> Does anyone know the absolute memory entry point for the AES?
> Can anyone help? We'll see.
>

It doesn't work that way. AES is entered through a 68000 trap, not through
an address.

I think Charles Johnson has made some unwarranted assumptions about what
can be found in the C bindings for the AES. The label "aes" may or may not
be defined. I don't know how Laser does it.

The following information may help you determine what he is looking for.

The AES is invoked by:

* copying the arguments to the function (file selector call, for
example) into "mailboxes." There are arrays of mailboxes, typically
labeled control[], global[], int_in[], int_out[], addr_in[], and
addr_out[]. I don't recall their sizes. The args are copied from
left to right in a C binding. Integers go into int_in[];
addresses (such as pointers to strings) go into addr_in[], etc.

* the control[] mailbox array is stuffed with an AES opcode
number (control[0]). Three magic numbers are stuffed into
control[1] through [3]. These numbers tell the AES how many
integers and addresses to expect. The numbers are contained in
the dlibs crystal.s module, if you're interested.

* an array of 6 addresses is loaded with the addresses of
each of the mailbox arrays (control, global, etc., as above).
This array typically is called the AES parameter block.

* The address of the AES parameter block is loaded into d1.

* The magic number 200 is loaded into d0.

* trap #2 kicks AES into action.

I think I've got all this right, but no promises. :-) I wrote some AES bindings in C for Sozobon before GEMFAST came out, and this is the strategy that I figured out from various published (non-Atari) documents and code snippets.

ron.sharp@canremote.uucp (RON SHARP) writes:

| Phoowie! The only way I can get simple information on memory locations
| is to become a developer, because anyone else who has the info isn't
| allowed to tell me.

There are several good books on programming the ST (including the MWC manual recently mentioned by Mr. Glasser - and it comes with a decent compiler, too).

| So I can spend $300 U.S. on a giant stack of poorly organized ... stuff.

You can purchase developer documentation by itself for a significantly reduced price. The latest release of the developer documentation is professionally printed, indexed, and includes several new addenda.

I think you should ask some professional developers what kind of support they have been getting recently for their hard earned bucks. There have been a lot of changes in the past few months, and there is more coming. I'm not talking words, either, I am talking _action_. I am thoroughly impressed with the steps Antonio Salerno and crew have taken towards making the U.S. developer's job an easy one, and Antonio has promised that the stuff developers have already received in the mail is only the tip of the iceberg.

For information on developing for the Atari ST/Mega/STE/TT, please contact Gail Johnson at Atari U.S. Corp. Her address is:

Atari Corporation
Attn: Gail Johnson
1196 Borregas Ave.
Sunnyvale, CA 94086-3427

Phone: (408) 745-2568

I think you'll be surprised at what you discover. Atari U.S. isn't leaving its developers out in the cold any more.

This is a pet peeve of mine. I spent a bunch of phone time long distance to people who should know CD-ROM. Apparently the High Sierra format 'bible' is a book 'published' by Sony. If you have an especially good story, they'll either sell or give you a copy. I didn't have a good enough story to get through at all. Besides that, the number of different things that can call themselves 'High Sierra format' is daunting. As far as I can tell, the standard covers finding arbitrary storage 'chunks', and finding the start of 'files', but nothing at all about file organization (like where are all the 'chunks' that belong to a file AFTER the first one). I could easily be wrong--after all, I couldn't get the information.

Thats great to hear! Its about time anyways, new ideas are what we are lacking these days. Here are some ideas that Im working on. Maybe it will spur more people to be creative in their thinking. Im working on an all new AI (Artificial Intellegence) operating system for my ST. Im tired of clicking buttons and using old DOS style commands(so Passe) Anyways I call my Artifical Intellegence program EDGAR(from the Electric Dreams Movie). Edgar interacts will me! I talk to it, it reponds, Partition P: please. Edgar responds" whats so special about partition C:" Well edgar remember this is where I keep my programming tools. SO what says edgar. Ill let you figure it out Edgar.

So Edgar has its own ability to learn and grasp my input at the same time respond to my commands, so I can quickly bring up the destop etc. I will try to install voice recognition etc as soon as possible. Anyways, I think I have made my point! Lets all try to move to a new generation of computer power Interactive Artificial Intellegence Operating System. If you think this cant be done your sadly mistaken..and your vision of the computer is limited to keyboards and MessDos style programming. I hope someday Keyboards and mouses (even though I dont mind useing them) will be a thing of the past like the typerwritter.

Dave Tomesch, Super BBS (519) 749-1206, Kwest Co-Chairman, StarTrak Inc.

gasp okay... I'm with you so far :)

| I'd be willing to post the technique to the net, but I would like to get
| confirmation from Allan or Ken that the "Pexec/H-blank trick" will continue
| to work in future TOS versions.

Yes. Applications are guaranteed to be launched at IPL 0. Amen.

| On a related point, there has been some movement to correct a long-standing
| inconvenience in TOS regarding stderr. Handle 2 is connected to the AUX
| port by default, but I support it's use as a redirectable stderr.

I agree. This is, unfortunately, something Atari can't officially
support, because it's possible that some drain bramaged software out
there acutally uses GEMDOS i/o for the serial port (even though it's
slow) instead of BIOS. Please drum up lots of support from lots of
developers on this issue, and test all of the supported software out
there that uses the serial port to make sure that it doesn't break,
and then Atari will support standard error standard handle 2.

The switch you're looking for to avoid PC relative overflow errors in the link phase is "-P". BTW, if you're interested, I have a commented template TCC.CFG file (ascii, unlike the TC.CFG) that I'd be willing to put up on the net. It's relatively short, and includes a list of all the warning switches and their levels.

The original posting asks "Is the ST version of Turbo C for real?"

Yes, it's for real; it's from Borland. It's not sold by Borland in the US, however, for reasons I can't fathom. The package is a solid one, and its code generation beats any 68000 compiler available for the ST, with the possible exception of GCC (maybe a slight advantage there). It has some drawbacks: it is _very_ strict - ANSI compliant to a fault. Because of some implementation details, it is difficult to get some kinds of "older" style C code to compile without modification. The libraries are complete, and the online help facility is wonderfully hypertextish. (is that a word? :)

The assembler that comes with the package, although it has some minor problems in 68030 code generation, is also very good. Supports motorola syntax, with macros, include files, and other goodies. And, like the compiler, it's incredibly fast.

A new TC version with a source level debugger is being worked on too... I have no idea when they'll have it ready, tho.

>

Steve ---

This is what still being a CS major in school and having no exposure
to the "real world" (tm) yet will do for you.

The article was probably right. C is still low down on the list of
most widely used languages. Most engineers and scientists still use
either ForTran or BASIC (or some derivative form of basic), most
economists and social scientists use either ForTran, and COBOL is
still number one with the banking and accounting crowd.

As far as most used language on a PC? MicroSoft and DOS saw to it
that BASIC clearly wins in that category. As a matter of fact,
when I first bought my ST, it came with BASIC and LOGO...for people
who don't want to do any serious programming, they probably wouldn't
buy a language, just use the interpreters that came with their machine.

So, don't laugh too hard...I did, but after getting my Masters, and
contracting around for about 5 years, and reading the trade journals,
and talking with other computer professionals....C still has a way
to go outside the computer science field.

>lots of extra stuff that might confuse or intimidate the novice ST programmer.

Since TOS fails to provide a system call to return you a
correctly-aligned, properly-sized chunk of memory useable as display
memory, it is *impossible* not to hard-code certain assumptions into
the code to do this. MWC needs no defending on this point.

>In my honest opinion, biased as it may be, the MWC manual is the single
>best volume for programming the ST published to date. It needs revision,
>bugfixing, and maybe some other tweeking (new GEM examples, etc.) and
>the compiler should be updated, but it is still a very good package at a
>good price.

There are some occasions where it leads to more frustration than
useful results, but care in marking corrections discovered through
trial-and-error will eventually produce a very comprehensive manual.
I consult my MWC manual first (since it's only one volume and fits
comfortably in my hand), and only when something doesn't work as
advertised do I break out the backup, the dreaded Developer's Docs.
Since the MWC manual seems to have been written from experience rather
than specs, it tends, when there is a disagreement, to be the
more-frequently-correct one.

In many cases the MWC examples demonstrate important points that
aren't mentioned elsewhere. On the other hand, at least one of the
examples doesn't work at all (I think it was the one that demonstrated
the use of fsel_input()). A new versions was published in the

errata with version 3.0.6 of the compiler, but *it* didn't quite work, either. These are the sorts of problems that extend the development time of what should otherwise be a quick and easy program.

However, since the wise programmer writes routines that are as general as possible, and reuses them as frequently as possible in new code, (or at least reuses code fragments) one should find the learning curve getting steeper with each project, as one discovers how to use more and more pieces of TOS properly. This has certainly been my experience.

>compared to the program in the toolkit.

You can't trust third-party docs any more than you can trust the Developer's Docs themselves. Remember, the developer's docs describe how the system was *supposed* to work. The Mark Williams C manual in many cases describes how the system *really* works, which can be a great blessing. Your best bet is to have at least two different sources, and cross-reference them. I have three: developer's docs, MWC, and the Abacus Internals book. I've given up on the Abacus book (mainly because it's a rather poor translation and too hard to read). Between MWC, DevDocs, and trial-and-error, I've managed to figure out most of what I needed. Oh, yeah, and Usenet helps too. :-)

As for building object trees without an RCS, if you manage to do it with anything complex, you're a better man than I. The simplest menu bar took me forever to build by hand, and I never did get it quite right. I tried to get Kuma's RCS, but The Catalog stopped carrying it just as I developed the need. Fortunately, Mark Williams released theirs with 3.0 of their compiler. I've been using it regularly and with great rejoicing.

You might be able to find Kuma's mouldering on some Atari dealer's shelf somewhere, if you're lucky; but Mark Williams supports theirs (and sells a good compiler/debugger to boot).

863. Words of wisdom on MWC behaviour needed

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 19:09:37 UTC
From: mj@myrias.com
Message-ID: <633294579.26980@myrias.com>
Source record: 244304

Does anybody has a sage advice what to do with the following
problem (short of replacing a compiler with something else)?

Setting: Mega ST with TOS 1.4, gulam shell and MWC 3.0.6 compiler.
Any program compiled with supplied MWC libraries which reads stdin.

An attempt to redirect on a command line stdin to come from a file
causes an 'exit()' routine to bomb out in the most interesting and
unusual manner. On my screen appears a messege "*** SYSTEM HALTED ***"
in a company of some other nonsense which informs me that the system
memeory is exhausted and advise me to use FOLDRXXX.PRG to avoid that.
Which is obviously bogus.

I hoped that maybe an istallation of poolfix3 (yes, version 3) will
improve the situation. Unfortunately it does not have a slightest
influence - at least on this.

All test programs work beautifuly, echoing nicely input, until they
hit exit(). THE CRASH does not happen when there are run under msh, OR
when run under msh or gulam but were compiled with MWC-zed dLibs
libraries. But I need a floating point, which dLibs does not support.
An attempt to use MWC printf with dLibs was partially successful in
that the the program behaves nicely and exits in a clean manner but it
does not print anything at all (probalby due to incompatible internal
structures).

Part of a problem obviously is caused by a fact that MWC thinks that
there is only one shell in a world and is called msh. Still I am
not very eager to pay good money for sources for their libraries
in order to fix their bugs. I feel that I already paid for a compiler.
BTW - MWC libraries contain, indeed, an undocumented function isatty(),
which, once again, works with msh only. Fortunately this is easy to
remedy.

In hope that somebody may come with a good solution,

Source record: 244305

I'd like to use the functions appl_tplay()| & appl_trecord(). Unfortunately, I still have old ROMs of 1985 (don't ask me the TOS version). As far as I could understand, these functions only work with newer TOS versions.

Does anybody know what is the bug in the old ROMs ? Is it reasonably possible to implement these functions by soft ? Where could I get the listings (in C, ev. in ASM) ?

N.B.: These functions allow to record every event. You can store these events, and play them back when you want. I think there was a question about it recently...

Hi world...

A few questions. First, It seems to me that it should be an easy matter to put a detachable keyboard on the 1040 ST. Does any company sell such a product or is there a simple way of doing it that does NOT involve a saw?

Also, I have heard that there are alternate cases out there for the ST (Designer cases?). Does anyone have any info on this? If so, who makes them, how can I reach them?

869. Re: How to Fix a Dead ST???

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 21:10:09 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1245@lzsc.ATT.COM>
Source record: 244310

In article <370005@col.hp.com>, don@col.hp.com (Don Allison) writes:
> How do you go about maintaining your Atari ST? I managed to kill mine in the
> process of upgrading the memory (it was flakey anyway, but it is really dead

Don't panic:
1. Atari does have its exchange.

If the product is out of warranty, you can send it directly to
Atari at this address:

Atari Corp.
390 Caribbean Dr.
Sunnyvale, CA 94089
ATTN: Door 17

It will be repaired or replaced at their discretion. If the unit
is no longer manufactured or kept in stock by Atari, they will
replace it with an equivalent or enhanced version at their discretion.

Repair/Replacement prices for ST equipment are as follows:

520ST $95.00

2. you may have slightly munged the socked for the mmu.

Standard fix: remove mmu, GENTLY flex the socket pins toward the center to
tighten them, reinsert mmu. This fixes lots of MMU problems.

3. check the power supply: if +5 +12 are there, there's hope.

4. for $100 you can become a developer, and get the schematics. I've seen
ref. to H. Sams having schematics for a 512.

good luck

871. Re: Question on use of Interleaves

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 21:31:11 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1246@lzsc.ATT.COM>
Source record: 244312

From: dlm@druwy.ATT.COM (Dan Moore)
in article <1230@lzsc.ATT.COM>, hcj@lzsc.ATT.COM (HC Johnson) says:
> The information with the Adaptec 4000 controller that most MFM systems
> use is to use interleave=1. There are 17 sectors on each track. With

I will write 16 != 18 100 times.

Straight from the book.
"The ACB-4000 series controllers are capable of reading one track of data
from the disk in one revolution of the disk. This is called noninterleaved,
or 1-to-1 interleaved operation."

"SECTOR SIZE BYTES/SECTOR INTERLEAVE SECTORS/TRACK
512 576 1 17
512 566 >1 18"

So the deal is with Interleave=1, Adaptec will deliver all the sectors on
one turn. Since TOS usually asks for 2 at a time, this is somewhat efficient.
The key question is how soon TOS will come back with the next request. I
think not too soon -- this is a ms/dos clone; no read ahead.
The result will probably be close to 2 sectors per turn.

Likewise, if Interleave >1, then it will take a little longer to get the 2
sectors for TOS (3 sector times instead of 2 for I=2) but it still is close
to 2 sectors per turn.

Since the Adaptec doesn't have to process on the fly, it can pack the sectors
tighter; leaving 18 to the track, which increases capacity.

Since I do cartridge tape backup and read a track at a time, it pays me to use
interleave=1. your mileage may differ.

From: 440488@UOTTAWA.BITNET
Message-ID: <9001260808.AA27873@ucbvax.Berkeley.EDU>
Source record: 244313

Hi all,
I got a small problem here. I'm trying to get the keyboard to tell me that the joystick button for port 1 has been pressed. I've written my own joyvec handler and do the $16 keyboard instruction to read the joysticks. I get the proper numbers for movements but no high bit set when I press the button. Do I have to set up some kind of initialization for this to occur?? I am doing this in assembler.

> METAFOUR tells me they have a good track record shipping all over
>the country, but what do you expect.

I've got one of these too; Quantum Pro-80 (with the ROM fix), BMS adaptor, room for another drive, et c. et c. I don't think that power supply is 200w :-), maybe 125 or so. Agreed it's total overkill. For the price, given that you can't/don't want to roll your own, they are fine.

I have to admit that Maurice Hilarius (that's his real name, folks) seems to have a bad time with the shippers. My disk wandered to Portsmouth, Oregon before it got the 150 km north from Edmonton to here. Sure was a loooong time a'coming. There was a similar long wait for an order of printer ribbons.

I don't think he's a scam artist, though; just a very small businessman with thin margins. It seems to come with the Atari territory :-(. I'm still dealing with him in complete confidence. I've just switched to going down and picking stuff up in person; that's always worked beautifully. Obviously your mileage may vary ;-).

>>My point is that piracy continues. Software rental places would
>>"legitimize" piracy in the minds of people who already think its
>>ok.
>
>Same logic applies to video rentals I think.
>

I still maintain that it does not. It takes time (2-3 hours) and great
expense (a second VCR) to record movies. Most movies also have copy
protection schemes that do not interfer with the viewing, but produce
non-perfect copies contain image wavering and sound dropout.
(As opposed to software copy protection, which
is a hassle for computer users to deal with.)

Movie theft continues, but not to the same degree. A video pirate cannot
easily mass produce or copy films without a great deal of equipment or
time. A software pirate can literally mass produce 100's of copies
of software an hour.

Furthermore, legislation in the video industry is *also* taking place.
Two years ago, JVC tried marketing a two cassette (one play one play and
record) VCR...they were "asked" to remove the model from their VCR
line.

877. DUCK31.PRG

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 22:41:31 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900125.16412988.013314@SFA.CP6>
Source record: 244318

Hello all,

A few weeks back, I wrote a simple program called DUCK31.PRG and it
is an upgrade to an earlier program written during the early part of
1989. It is a hard drive bootup program similar to other programs on
circulation in which the computer is reset after a time delay during
bootup. The reset allows the computer to boot from the hard drive.
Duck is similar to the other programs but differs in that it
has a delay change feature from within the program rather than via a
text processor. It seems to be fairly solid and has been used by several
STers who are quite happy with it.
I have received reports that it is not working with some STs and for
the life of me, I can't figure out why. Problems are that the program
simply stops its reset process and bumps to the desktop. The user is
unable to use drive A or B icons. The problem shows when
a startup disk with DUCK31.PRG inside of A:\AUTO\ is in the computer and
when power is applied to both hard drive and computer. That is when
Duck is supposed to work, i.e., DELAY then RESET.
On most other STs, everthing works fine. There is a delay, the
computer is then reset, and then the hard drive comes up. The present
ST that doesn't like this program is a 1040ST with a BMS host adaptor.
Duck's pseudocode is simple:

```
READ DELAY VALUE
DELAY
RESET COMPUTER
```

Duck has been tested on a Mega2 ST and Mega4, a 520ST and 1040ST.
Hard drive host adaptors include the unit inside of the SH204, and
the ICD adaptor. I don't have access to Supra or BMS adaptors. Because
Duck worked with the Atari and ICD units, I assumed that the program
would work and was ready for release.
'Nuther clue. All of the STs which have been successful with
DUCK31.PRG use TOS versions 1.2 and 1.4. I don't have access to earlier
TOS versions.
If anyone can provide clues on how programs behave when booted
from powerup from within A:/AUTO/ and when the hard drive is also
given power at the same time, I sure would be appreciative.
...just another reason why I wish we had some documentation. SIGH
Note that DUCK31.PRG is available at Panarthea and on GEnie.

878. Can I program a Portfolio?

Newsgroup: comp.sys.atari.st
Date: 1990-01-25 23:21:10 UTC
From: ckp@grebyn.com
Message-ID: <14160@grebyn.com>
Source record: 244319

[What's all this I hear about a line-eater?]

OK, the Portfolio seems like a nifty, useful machine. MS-DOS compatible, it says (2.11), and a few built-in applications, and RAM carts. Good price. But, see, I'm a programmer, and I'll be wanting to write my own programs for it, or else I'd just get a Wizard or BOSS or some such.

So how does one go about programming a Portfolio?
Do I need to buy an expensive development environment and sign up for developer support programs? Or can I downloads into it using the serial port, from a regular MS-DOS machine? And does it *really* run MS-DOS 2.11?

I don't really think this is the "proper" place to post this, but this is about the only active Atari group I can find.

>to go outside the computer science field.

Hmmm, so far my work terms have included:

Ministry of Transporation - dBase III+, Clipper, Lotus 1-2-3, Pascal on PCs
GE Plastics - Oracle (SQL) on a VAX 8350 (yes that says 8350!)
EDS (part of General Motors) - Fortran on a PDP-11/70 and a 4GL on a HP3000

All the jobs (except one) I have applied for this term are programming
in C on a Unix (or Unix-like) environment.

I have yet to touch BASIC while programming in the "real" world. Guess
I'm just lucky!

I've got the 512K blues. I'm using a 520STfm with a double-sided drive
and the RAM mounted under the power supply. A friend and I installed
sixteen 256K chips in the second bank. At first, the ST wouldn't even
boot with the chips installed, but after looking at a similar 1040ST,
we put in a few resistors and that problem was stopped. To the best
of our testing ability, all the chips work, but the MMU ignores the
second bank by sending the CAS line to HIGH. Does anyone have any
suggestions?

In <26640@brunix.UUCP> rjd@cs.brown.edu (Rob Demillo) writes:

-> Several of you (Phil, Greg) are missing my point. I am willing to
-> accept the premise that you two are honest. *No one* is accusing
-> you of being otherwise. If you borrow a friends software to test it
-> out fine. If you can talk a dealer into giving you a demo, fine. If
-> you can get a demo from the publisher, fine. I have done all three
-> of these things, either returning my copy if I didn't want it, or
-> buying it if I did. However: software rental places are open
-> inventations for all the non-Gregs and non-Phils to easily copy
-> (i.e. STEAL) software.

I'm only going to dispute this one point, as you have consistently glossed it over every single time you've rebutted other peoples' arguments.

What you refuse to concede is that *most dealers and publishers do not demo software*. Period. Perhaps 5-20% of the high-end commercial programs out there have demo versions (the number is even smaller for inexpensive programs), and maybe 2-5% of dealers (and then only the ones who sell hardware to begin with) will do an in-store demo.

Further, most dealers have no-return policies because they think too much like you- that nearly everyone who returns a product that sucks has in fact copied it and will distribute it. Presumably the existence of copy-protection on many programs should give the dealers a reason to accept returns, yes? No? Then why have the protection on there in the first place?

Please, if you're going to flame me about economic infeasibility and how the market would simply shrivel up if dealers accepted returns in lieu of doing demos, at least concede that one point- that most programs in most places cannot be demoed and the buyer is, in effect, buying blind.

Oh, please. Now you're becoming sensationalistic. Even with four
floppies, it takes a good couple minutes to set everything up, copy
the disk, etc. Most swap meets I went to in my C64 days were barely
organized and you'd be lucky if each person came away with ten new
programs after a few hours of copying (and this was int he days of the
15-second copy). With protection, it might be necessary to tweak
things till they come out right, reducing efficiency further. I can
see perhaps even 50 copies in an hour, but "100's"? Baloney.

>--Gerry
>maxg@suvm (bitnet)
>ggreenbe@rodan.acs.syr.edu (internet)

Yes, I have been using it for a long time (ca. 1.5 years or more). It's a little program that replaces the desktop icons (the ones for files and folders) by much nicer ones. You can set wildcards for the various icons and you can even create your own ones. It's really neat and I love it. However, if you have one of those alternate desktops, you won't need it since those desktops have icons on their own.

As far as I know the accessory is written in a non portable way. It assumes TOS 1.2 (Blitter-TOS), and patches the TOS directly (I don't know this for sure, it's just a rumour). Because of this I don't expect it to run under TOS 1.4 :-((No, I don't have TOS 1.4 yet :-(()

886. More Turbo C info

Newsgroup: comp.sys.atari.st
Date: 1990-01-26 08:04:47 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <9001260804.AA27605@ucbvax.Berkeley.EDU>
Source record: 244327

Hello all,

This is in response to several messages I received after my posting about Turbo C/ST.

First off, here's what you can do if you're in the USA or Canada and would like to be able to buy an officially Borland-USA-supported Turbo C/ST, with all-english documentation.

Write a letter to

Mr. Philippe Kahn
Borland International, Inc.
P.O. Box
Scotts Valley, CA 95066-0001
U.S.A.

asking him why you can't buy this fine Borland program in the US or Canada even though it's sold succcessfully throughout Europe. (I hope I got the address right, and I don't have the correct PO box, it's 60001 but for orders only, I think).

Next, some people asked me about the address of the German Borland, and details on the current TC/ST version.

The address is:

Borland GmbH
Lindwurmstrasse 88
D-8000 Muenchen 2
West Germany Telephone (89) 720 10-123 (customer service)

The current Turbo C version is 1.1. It costs DM 228 or DM 342 with assembler and symbolic debugger (I think 1$ is a little less than DM 1.80).

Borland plans to release the new V 2.0 in March. Included will be a source-level debugger, a PC-compatible BGI implementation and more goodies.

I had offered to organize a bulk order tp ship to the US, and my offer still stands. I still have a list of the people who were interested. The general consensus seemed to be that we should wait for V 2.0.

Although Borland Germany is working on it, there is no clear word on when/if there will be an english version of the docs.

Note that there is no version of Turbo Pascal, nor will there ever be one (unless Mr. Kahn changes his mind).

I cant answer your question but your message did make it to Toronto.
Actually I wanted to ask you if you had any details about the concert at
Knebworth on June 30. I'll be flying over to London a week before and
would like to attend.

On the same lines.

Can the ST drive a Philips 7502 monochrome monitor (European) ?

890. More info on Turbo C/ST

Newsgroup: comp.sys.atari.st
Date: 1990-01-26 10:04:25 UTC
From: RiddCJ@computer-science.birmingham.ac.UK
Message-ID: <9001261004.aa00893@benjamin.Cs.Bham.AC.UK>
Source record: 244331

When I looked at the MACCEL2.PRG recently posted in RAINBOW.ARC, there was a message like 'Turbo C 1.1beta Borland International'. MACCEL2 was written by KenB, no? ie Atari seem to have a copy (or copies) of Turbo. Lattice 5 is supposed to blow away Turbo on executable speed, incidentally, so Turbo might *not* be worth the wait. I still haven't seen either (being the right side of the pond doesn't help), so... :-)

893. GFA BASIC 3.0 problems

Newsgroup: comp.sys.atari.st
Date: 1990-01-26 14:45:05 UTC
From: kacovert@miavx1.acs.muohio.edu
Message-ID: <726.25c01c22@miavx1.acs.muohio.edu>
Source record: 244334

In August 1989, I bought GFA BASIC 3.0 (Version 3.05) because I had heard so many good comments about GFA BASIC 2.0. But to this date, I still have not received the final manual (I just have a unedited version that was sold with the package) and I have found that the program is so full of bugs it is unusable. I have since resorted back to using version 2.0.

My questions:
1. Has anyone else received the final maunal?
2. Is version 3.05 exceptionally buggy or just my copy.
3. Is version 3.07 any better?

Thanks in advance,
Kent Covert
Miami University
Oxford, Ohio

BTW, I got my version through Antic Corporation.

As Rainer Klute (author of Arcgsh) posted in an article local to germany,
Arcgsh doesn't work together with the new arc due to some failure in his
xArg-code (which didn't pop up before 'cause zoo doesn't use xArgs though
said to use it).

I beleive that's true for the other user interfaces, too.

I don't think its bogus.
It sounds as if you have not release some memory from one program to
leave enough for fsel(). AND OR
you have created recursive calls to the system to use up all the system
memory.

Give TOS a chance; use foldrxxx.prg to up the space avail to the system.

Just an opinion.

]> West Chester, PA
]
]It is possible to connect a 1084 to a 1040. The only thing you need is a
]cable with a Scart connector for the 1084 and a monitor plug for the ST.

An important note:
A friend of mine has an Amiga-monitor for his ST (using a scart
cable) and therefore I bought such a cable, too, when I got my colour
monitor. But when buying the Comodore-monitor, I was told by the dealer
that newer ones don't have the Scart-connector anymore !!!

(This surely will not affect you, Randy, but might be quite important
to others...)
I got the right cable by Voelkner Elektronik, but it had swapped red and
blue first... This might be due to the differences between STM and other
STs.

Despite this little problem an me running a hole afternoon between
several stores, my monitor works really good. And it was about $100 cheaper
than the SCM 1224 from Atari !

Source record: 244345

Hi, having just finished Chaos Strikes Back, I have a few questions for anyone else who has completed it or is near completion...

For the task that you need the green gem for, I seemed unable to achieve the objective despite having the green gem. Any ideas?

Also, has anyone figured out what the orange gems are good for?

Did anyone find the armor of sar? I only found the shield...

Also, where were the RA keys located? I got one from a knight I believe but I never found a second one.

All in all, I was surprised how fresh the game was and although it used invisible doors a little too much (annoyingly so at times), I really enjoyed it and now want to go back through and trash monsters for the hell of it....

Anyone else done yet?

>structures).

To be honest I had a hard time understanding your post. Perhaps you
could repost, rewording things so it is a bit clearer.

One thing that I did understand is that you are having a problem
printing floating point from MWC. Since printing floating point
can take a fair bit of code and since most programs don't bother
with floating point, the printf function in MWC does not normally
support floating point. If you want to print floating point variables
you use printf as you would normally but you have to specify an
extra flag in the 'cc' statement to tell MWC to include the floating
point stuff.

This should all be explained in the MWC manual (probably under 'printf'
or under 'cc') and I suggest you look there since I have not used
floating point with MWC for quite some time (ie. I may not be
entirely correct).

| Emulation using add-on card. Couple years ago I heard there is such a product.
| i wonder if they still have it. Do anybody know where can i get this product
| and have anyone experienced using it? How much does it cost? (the whole system)
| Thanks for your reply....I'm appreciated.

Where's this person been?

Spectre GCR allows Mac emulation at slightly-faster-than-mac speeds
(unless you have the 16MHz upgrade like I do, in which case it is a
lot faster), including reading and writing Mac-formatted disks. Its
little brother (still called Magic SAC? I dunno) reads a certain kind
of Mac disk, but not just any kind. It's available at most fine ST
stores, or by mail order, I imagine.

The emulation is so complete that it is even susceptible to Mac
viruses!

Just another ST owner (with an occasional Mac screen popping up),

Rainer, I wrote that before your explanation arrived at our site. Remember USENET articles do not arrive at all sites at the same time (not neccesarily even in a timely manner :-).

Thanks for the explanation of the problem. I had not realised there were programs that used the extended argument passing "mechanism".

>was a proliferation of software rental places, how long do you think
>software manufactures would stay in business?

Software rental places can make the symptoms of software piracy worse.
But attacking them is attacking a symptom, not a cause. So educate the
users, don't put legitimate businesses serving a legitimate need out
of business. (We have already show you several situations in which
renting serves a real need: extended demos of expensive packages and
dealers who refuse to demo software.)

[...]
>I *can't* think of an analogous example because there *isn't* one.

How about this: You can't rent a hotel room in North Carolina (for you
non-USA people, that's a state in the USA) unless you are 21. It
seems that the legislators are scared that younger *adults* might be
fornicating in these hotel rooms, which is illegal. Instead of
dealing with the cause, they treat the symptoms by taking away the
rights of everyone between age 18 and 21. I admit it, I have violated
this law, although I didn't even fornicate. But, I must admit, it
would have been quick and easy to fornicate in that hotel room.

Finally, can we take this discussion somewhere else? It doesn't have
anything to do with the ST anymore.

914. MICRO RTX vs. MT C-Shell and VSH

Newsgroup: comp.sys.atari.st
Date: 1990-01-26 20:06:45 UTC
From: david@bdt.UUCP
Message-ID: <1021@bdt.UUCP>
Source record: 244258

Shortly after the the release of MICRO RTX as shareware, my mailbox became flooded with "What does it do?" "What is it?" "How do I start two windows at the same time?" questions. Many people have asked for more information.

There seems to be a great deal of confusion on this, so I have prepared this brief posting.

========
Beckemeyer Development Tools Multitasking -- MICRO RTX vs. MT C-Shell

Micro RTX is a Real-Time Multitasking Executive. Micro RTX is a general purpose operating system kernel. It is the kernel used in the MT C-Shell system.

Micro RTX also implements multitasking TOS compatibility. It implements all the GEMDOS and BIOS calls and adds some new TOS-level calls as well.

Micro RTX is not an end-user application and includes no intrinsic interactive programs. It is more like a subroutine library; RTX by itself doesn't do anything. Micro RTX is a tool for developing stand-alone multitasking applications. MT C-Shell is an RTX application that emulates a UNIX environment. Micro RTX is very simple and general purpose. It has very few fundmendal limitations and is easy to customize via program extensions and "hooks". MT C-Shell installs hooks into RTX that support a UNIX-like multitasking multiuser environment. MT C-Shell actually extends the RTX kernel, just as any other RTX program could.

The standard (non RTX) TOS system breaks down roughly as follows:

Application Program and its Libraries
|
v Application Layer
============
| System Services Layer
v
GEM AES services
|
v
GEM VDI services
|
v
GEMDOS services
|

v
BIOS services
|
v
XBIOS services
|
v
Line A services

The system services are not perfectly layered. An application may actually use a set of services at various layers in a number of acceptable combinations (e.g. GEMDOS only, AES/VDI only, AES/VDI and BIOS etc.) Non graphics applications (e.g. .TOS or .TTP) typically won't use the GEM services. Some graphics applictions may bypass the VDI and use Line A directly.

MICRO RTX installs replacement GEMDOS and BIOS system services and installs a new set of "MICRO RTX" services. Applications that use the normal system services won't be affected. However, applications that "know" about the new services can take advantage of advanced system features for multitasking, interprocess communication etc.

MICRO RTX provides the low-level building blocks for building a higher-level OS interface. Such an interface is demonstrated in MT C-Shell and the VSH Visual Shell. RTX could also be the basis of a stand-alone application which could benefit from multitasking, such as TurboPOS, where multitasking and interprocess communications services of MICRO RTX are used in a sophisticated multi-user distributed data-base system, based on the client-server model.

VSH is an "outer-layer" to the basic MT C-Shell which provides a GEM windowing interface. It sets up device drivers and a GEM application/accessory to manage "virtual terminals", running commands inside GEM windows, even while another GEM application is running at the same time.

Networking is another application benefiting from multitasking, where server tasks can run "in the background". This is used in our Point-of-Sale cash register network and several other BDT internal applications.

SUMMARY

MICRO RTX loads into the AUTO folder and just sits in memory until some program uses it. It provides a bunch of new system services for applications. It just does what it's told by programs -- IT HAS NO INTRINSIC USER INTERFACE!

MT C-Shell and VSH are examples of programs that use the extended services offered by MICRO RTX, to implement a multitasking/multiuser Unix-like system with GEM windowing.

TurboPOS is an example of a program that uses the extended
services of MICRO RTX to implement a multiuser point-of-sale
distributed database system with an optional cash register
network.

I guess I just don't know how to say it any clearer. If
it still doesn't make sense, please don't ask me "What is RTX?".
If it isn't clear from the above, then there's no way you'll
ever be able to use MICOR RTX for anything anyway, so just
pass over it and wait for somebody to develop a nice friendly
front-end to it.

>
>p.s. dont bother buying it for games coverage though as there isn't any!

Too true, ST World is a great mag, full of in-depth reviews of hardware and software (recently it has shown a lot of interest in American proggies from the likes of Codehead). It's got some programming stuff, PD bit, comms area, a page on emulation stuff, oooh and lot's of other juicy info.

I don't entirely agree with the comments on how badly the ST market over here is. A lot of the general *down* feeling has been generated by these mags (ST World excluded), although I must admit the Atari UK deserved to do badly this Christmas. I saw one telly advert about the Atari 800 games console! None at all about the ST, while I saw the Amiga ad at least twenty times....which would you buy?

It's about time someone at Atari UK got their finger out. All they've done since Christmas is accuse Commodore UK of lying about sales figures in a pathetic attempt to cover up their own abysmal results.

Mark (still rather pissed off) Davidson

What exactly is poolfix? what versions of Tos need it?
Another question: I have the program FOLDR100.prg which came with my hard drive. I understand that there is a bug in Tos which causes problems when you have more than 40 folders. Does this mean open folders, or just total number of folders? I haven't noticed any difference in my system's operation between when I use this in my auto folder and when I don't. What _exactly_ is the 40 folder bug, how do I find out if I've got it, and what will happen if I don't use foldr100.prg? My system is a 1040 with 1 meg, 2 DS drives and 1 Megafile 30. (I don't know what Tos version. I bought my ST in 1987.

>[blah, the STe is] widely available for
>a price only f 300.= (about $150.=) above the normal 1040STf price.
>Kees van Reeuwijk

Eh? It's meant to be sold for the same price as the 1040ST! The STe was supposed to justify the price difference between 520 and 1040 models.

On a different subject, can anyone tell me about David Beckemeyer's MT-C shell? I wrote to the man himself but he never replied (I guess he's to busy).

Does this shell allow GEM/TOS programs to multitask? How does it handle displaying two GEM programs? Is the program Shareware - if so where can I obtain a copy to try out? If it is a commercial product can anyone supply the address of a dealer that sells it?

Thanx,
Mark Davidson.

From: FNDDR@ALASKA.BITNET
Message-ID: <9001270809.AA23530@ucbvax.Berkeley.EDU>
Source record: 244264

In message <17179@laurel.athertn.Atherton.COM>, Alex Leavens asks:
>Is anybody familiar with the High Sierra CD-ROM format
>spec, and if so, how/where I can get information on it?
A CD-ROM VAR told me last fall that High Sierra was being phased out in favor of ISO 9660 formatting, which is supposedly upward compatible. I've been using their ISO-compatible software with High Sierra disks on a PC with no problem. The ISO standard might be easier to obtain...I think that our library has it on fiche along with the rest of the ISO and ANSI standards.

I'm beginning to think that CD-ROM is a passing fad like 8-track audio tapes. They will probably be popular for another 4-5 years until R/W optical disks come down in price and increase in speed. Oh well, 4-5 years is almost forever in the computer industry.

Good luck,
Don Rice FNDDR@ALASKA.bitnet

921. Re: appl_tplay() & appl_trecord()

From: kbad@atari.UUCP
Message-ID: <2003@atari.UUCP>
Source record: 244265

There was an auto folder program distributed once upon a time which
fixed the specific bugs with appl_tplay() and appl_trecord(). It
was distributed with an ST demo program that went out to many dealers.
It is possible that the Atari customer support people in your country
have a copy of this program. Check with customer support at your
subsidiary.

Better yet, get Rainbow TOS (1.4)!

Piracy is not going to be prevented by educating the users for the ST or any other computer. What will put a damper on piracy is if the users can respect the software company. Companies need to support their products instead of making it hard for someone to get an upgrade or a working copy of the product should it prove to be defective. And copy protection! Let's discuss THAT! How many people here have had programs that they have purchased eventually stop working because of COPY PROTECTION? There are some programs out there that are a true test of drive alignment.

I also would like to say that anyone who is under the impression that there is more piracy on the ST then other computers OR that ST pirates are more organized is truly suffering from major delusions.

>easily mass produce or copy films without a great deal of equipment or
>time. A software pirate can literally mass produce 100's of copies
>of software an hour.

1- The video pirates, say in a 3rd country. CAN easily produce many copies and
DO so.... unfortunately for the movie industry

2- If a s/ware pirate wanted to "mass produce 100s of copies" he (or she :-)
must be doing it for financial benefit....and in that case would STILL do it
by buying an original and copying that......such a person could then even sell
the original......

So should we also ban the resale of s/ware under the assumption made above?

Please note that I do not necessarily disagree with the points made against
s/ware rentals but just feel these points should clear some of the analogies
that do not really fit .

Regards

Imran

927. Re: Mac ROMS

Newsgroup: comp.sys.atari.st
Date: 1990-01-27 07:16:09 UTC
From: dsmall@well.UUCP
Message-ID: <15754@well.UUCP>
Source record: 244271

The base message concerns mentioning that the TT runs Mac software with the aid of Mac ROMs, and presumably, Spectre software (since 64K ROMs cannot handle the differences in the 68030.)

Unfortunately, someone at Atari saw fit to say that the TT ran Spectre. It doesn't today.

We at Gadgets don't *have* a TT. We can't get one, and we have tried every possible way we can to get one. The technical data is ... well, conflicting (not surprising, given its source).

Hence the rumour that the TT runs Mac software, say, from Atari's press release in Comdex and from Macintosh News, is *completely false*.
While there are a few machines out there to developers, Atari hasn't seen fit to grace us with one.

(I'm sorry if I come off as irritated. It hacks me off to be promised a machine, eternally 2-weeks-mored, never get one, then have Atari announce that gee, I've already done the software port -- having never seen the machine! Sheesh!)

I simply don't understand the policy of not getting us a TT; the Spectre GCR would be a natural to help sell TT's as high powered, low cost Mac workstations.

While it's not definite, it is very possible that with our current schedules, Atari's missed the timeframe within which we could have "ramped up" on the TT -- even one in an IBM clone case, such as exist, I wouldn't mind. That'll set the TT/Spectre GCR back even farther.

If you want to do me a favor, and possibly yourself a favor, drop a letter (papermail) to Atari asking why they won't help us bring up a TT version? Every other manufacturer "seeds" software sites for a machine's rollout and release, and we can sell a *number* of TT's.

Anyway, <mild flame off>. Thanks --

Dave Small / Gadgets by Small / ST, not TT, programmer.

The basenote asks some Spectre GCR questions. (Hmmm..
comp.sys.atari.st.spectre
would sure save non-interested readers some time .. *grin*)

On a 1 meg ST, you end up with an 832K Mac. This will run Hypercard
pretty well, as well as nearly all software but extreme memory hogs
(say, FullWrite Professional).

Retail is $299. Discounters discount, but make *sure* they have
stock before sending money, *especially* since the big distributor CSS
folded up -- that's still making waves!

The ROMs that are required with it go for around $125, I've been told
many times.

932. RAM problems

Newsgroup: comp.sys.atari.st
Date: 1990-01-27 09:14:00 UTC
From: JOHNMAR@IITVAX.BITNET
Message-ID: <9001281531.AA01380@ucbvax.Berkeley.EDU>
Source record: 244276

I tried to upgrade my computer to 1 meg. It did not regester and by the advice of some of you out there I got the March-B memory tester. I ran it and found that the mmu only showed 128k in the bank 1: I changed the higher address to 100 000 and it printed out error 'expected 0000, got 0001' and other times 'expected 0000, got B243.' Then I ran the program again and the program found that there were no errors and the mmu showed 512 in 1

1:. I ran it again and again and the program now said it had found no error. I rebooted and the 512 still showed up in bank 1. So I tried falcon to see if the two player option (available on with 1 meg) worked. The computer bombed with vertical lines runibombed with vertical lines runi
ng down the screen. <The computer bombed with vertical lines running down the screen. I then checked once again what the mmu said I had in bank 1: Now it was back to 128k. Again after the error messages the mmu message changed to 512k and there were no more error messages. I tried out Degas Elite and again the computer bombed. There were three bombs and then there were the vertical lines. Everything that doesn't take advantage of extra memory works fine. The error messages start at 80 000 and continued at all addresses. What sort of error am I looking at? Are the new ram chips bad or is my mmu broke or have I hooked something up wrong? I haven't checked all the addresses > 80000 but what I did check gave an error message (except for the times when all the memory tested fine). Could anyone help me find my problem?

Thank you

Mark Johnson

>

The following is what I use in Mark Williams C to see if GDOS is installed:

```
.shri

.globl gdos_installed_
gdos_installed_:
link a6, $0
move.w $-2,d0 / set d0 = -2
trap $2 / call system
cmp.w $-2,d0
bne.s L2
clr d0
bra.s L1
L2:
moveq $1, d0
L1:
unlk a6
rts
```

What it does, basically, is sets D0 to -2, calls GEM (trap #2), and sees if the -2 in D0 was changed by GEM or not. If it _was_ changed, GDOS is installed, otherwise, GDOS is not installed. This assembler routine returns a 1 if GDOS is, in fact, installed.

Thomas-Martin,
The traditional manner to tell if GDOS is loaded or not, for versions 1.0 and higher, is to implement the following assembly language routine. That's probably what your compiler has hidden behind that call of yours ;-).

```
move.w #-2, d0 ;set d0 to -2
trap #2 ;call system (GDOS, or not GDOS?)
cmp.w #-2, d0 ;GDOS will modify...
beq gdos_not_installed
```

Anyway, that's the way _I_ do it... Wrap it up in compilerese (with links and unlinks, and such) and voila, you've got a nifty little GDOS tester!

I just ftp'd to get uw from him1. It looks as if this is for the Mac.
Does something like this exist for the ST? If so, are there special
Unix requirements (sockets?).

Message-ID: <9001281112.AA19328@ucbvax.Berkeley.EDU>
Source record: 244282

Hello friends.

I was wandering round the local newsagents when my eye fell on the latest issue of ST-world. Inside (for it feel open in my hand) was an article saying that the latest issue of Quick-ST was to be commercial, not shareware, because the authors were not getting enough shareware contributions. I am not too bothered by this particular piece of software (when I tried Quick ST it caused endless difficulties and with real relief I deleted it. That's why _I_ didn't pay a shareware fee!), but it reminds me of something that's been bugging me for a while...

I think shareware is a dead good idea, but I do think authors could make things easier for us users who are willing to pay. To wit, how are we Europeans supposed to get the dosh to North Maerican authors? Have you thought of that, eh? After all, Europe is the spiritual home of the ST, but NA is on the fringe. I can write cheques in any European currency, as can most over here, but practically nobody can easily send money to America. The same maybe applies to americans wanting to pay for European shareware...

So, can't shareware writers do a bit of collection exchanging? Ask an active author on the other side to collect the money and forward it as a lump, do the same for her, and publicize both collection points in the "About Burble" bit.

Just a suggestion, but I think it's a good one. And I might even try Quick ST if I could try it first. After my previous experience I wouldn't touch a commercial version with a bargepole!

Well that's about all.

Love, Me.

PS I saw some undergraduate kiddy from somewhere saying that C is obviously the only programming language in use, because he only applies for C programming jobs. Has the concept of self-selection influencing statistical samples penetrated over there? Mind you, I agree that Basic stinks, though all these XYZ QuackBasics etc seem to have their followers. In the engineering world though, Fortran is still King. It's not ideal, but at least one can be sure that for any decent computer anywhere in the world there will be a Fortran IV compiler, if not an F-77 one. I write C too, in fact mainly now, but anyone thinking it's the standard is deluding him/herself. When there is a standard C (and I see ISO is not going to take the ANSI standard) and not two or three it may have a chance. Gosh, what a long letter. Sorry pals.

939. DUCK31.PRG and BMS, old SH204 host adaptors

Newsgroup: comp.sys.atari.st
Date: 1990-01-27 17:08:55 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900127.11082975.014492@SFA.CP6>
Source record: 244283

Hello all,

From letters that I've received, and this isn't final since there
are bound to be 'silent sufferers', DUCK31.PRG doesn't work with BMS 100
host adaptors and a number of very old (first release???) Atari SH 204
host adaptors. Letters received have been very positive from those who
basically wonder what and where the problem is and are the majority. Five
STers are having problems (I've received about forty pieces of mail).
My main error in writng DUCK31.PRG was that I assumed that STs had
no problem in reading the floppy drive during bootup via the A:/AUTO/
sequence AND (!!!) hard drive 'spin up'. None of the local STs have
a problem, hence, I do a floppy data file read during bootup. A BIG
NO NO!!! Well, maybe a little NO NO since most STs have no problems. My
goal was to make a delay program very easy to configure without use of
program renames or document processors for the delay value. Lesson #1
from a hobbiest programmer who knows not much of 'nutin about programming,
don't assume that all ST bolt-ons and ST computers behave the same way
because they don't.
So, regarding DUCK31.PRG, use at your own risk. It may or may not
work. If it does, it makes life a lot sweeter with hard drive use, if
it doesn't work...oh well. Such is life.
The following is a comment by STeve Jacobs:

"The problem you describe sounds like the dreaded SCSI-Reset-timing problem
(most often seen with an ST296N connected to a BMS-100). Basically, the
drive controller gets reset m essages the wrong duration and with the wrong
timing, according to the SCSI standard, and locks up. It takes all floppy
communication with it. The problem is 100% hardware, and the solution has
to be hardware too. The recommended solution is to send the BMS-100 and $75
to BMS in exchange for a BMS-200, which treats drives better.
Steve J."

> A few weeks back, I wrote a simple program called DUCK31.PRG ...
...
> I have received reports that it is not working with some STs and for
>the life of me, I can't figure out why. ...

I have just installed A:\AUTO\DUCK31.PRG on my Mega ST2.
It is the only program on the floppy. When I turn my system on,
I flip all the necessary switches. The program DUCK31 starts up,
and after about 15 seconds it seems to do a warm boot. In the
meantime my FA*ST 30 hard drive has finished going through its
startup routine, and has stopped its twitching and humming.

The system then goes through all the steps that it used to do
before I installed DUCK31. The advantage is that now I can turn
on all the switches at once. I used to turn on the hard drive
and then wait 15 seconds or so before turning on the Mega ST2.

>
>What exactly is poolfix? what versions of Tos need it?
Don't know, but I think it only works with TOS 1.4, but it is supposed to
be harmless if you run it with any other version. It is said that
it check the version number. If it is not 1.4, it quits.

> What ... is the 40 folder bug,

The 40 folder bug works something like this: If during one session,
you "visit" more than 40 or so folders, the system gets confused
and can not find directories and files. When that happened to me
I turned the system off and did a cold boot, and the system then
was able to find things again. The program FOLDR100 changes the
problem into a 100 folder bug. If you have more than 100 folders,
you simply up the number. Currently I have my program named
FOLDR300.PRG.

> how do I find out if I've got it,

I found out when I got a window saying "unable to find file or
application". I felt sure that the file was there. I tried to
erase a file. The system could not find it!

I just got 32 1MBitx1 DRAMS, that I would like to expand my 1040ST's memory with. I took a quick look through Start Magazine for memory kits, and I saw 4 of them. They were:

1) Tech Specialties
2) New World Upgrade
3) Arco Board
4) Z-RAM 3D/4Meg

Has anybody any experience with any of these upgrade kits, they could fill-in the Net about. Like, how easy was it to install? Was there any soldering/trace cutting involved? How reliable has the memory upgrade been? Did it interfere with any other upgrade boards installed?

Thanks for any info

Message-ID: <90Jan27.165836est.58957@ugw.utcs.utoronto.ca>
Source record: 244294

Lately, I had postings to the net bounce; turns out a new mailing address is being used. The following is a repost of one message.

Subject: STE Problems (Word Plus)
To: <INFO-ATARI16@SCORE.STANFORD.EDU>

The new STE has given me less than memorable moments (an addendum sheet to the manual rather than an update sheet, no demo software to show off its features, a save desktop bug that needs an AUTO folder correction, Word Perfect won't run, Neodesk won't run, ...). Now, I find that Word Plus is flakey. After a double click to launch the application, about 3 or 4 times out of 10 the code will actually run. Alternatively I get 2, 3 or 4 bombs (the dual bombs freeze the STE). Some of the time the message ILLEGAL AES INSTRUCTION pops up. The STE has been a real pain so far.

Another problem; once in a while a double click on an appl brings up the show/print/cancel dialog box because the system does not recognize that a .prg file has been accessed. What the heck is going on with the new TOS????

Earlier on the net I had posted a note about problems with the FrankenSTein memory upgrade board. While I am still having these problems, at least Canoe Computers, the supplier, is providing excellent feedback trying to solve my problems. Hopefully, I can get a working board soon so I can crank up REVOLVER on my STF at my workplace.

952. FrankenSTein and Revolver

Newsgroup: comp.sys.atari.st
Date: 1990-01-27 22:02:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Jan27.170350est.58970@ugw.utcs.utoronto.ca>
Source record: 244296

I called the Revolver support number (I apologize but I cannot remember the name of the person I was speaking with) and it seems that Revolver crashes are related to the fact that my FrankenSTein board does not allow the RAM chips to refresh properly (the cable leads to the board are too long). I was told that bits above the standard 1 meg on my 1040STF will be flakey and I can expect future crashes. I tried calling Canoe Computers in Alberta (they make the board) today but no answer. I want to speak with Canoe to see if there is a work around.

As an aside, I raised the issue of being able to roll out of ST RAM partitions on the ST to PC and Mac partitions and I was told that Revolver comes with the source code to do just that. All that is needed is Dave Small to provide a jump back from Mac mode (currently Dave checks for RAM fragmentation and will not let Spectre run if a fragmenter like Revolver is active) or for a PC emulator group to write a jumper to have the 68000 regain control. Once this is done, PC, Mac and Atari modes would be accessible by simply rolling between RAM partitions. IMAGINE having PC, Mac and ST modes simultaneously in RAM and being able to switch between them. That would make Revolver a HOT HOT product.

As I was told today, Revolver is only selling 15 copies a month. That's a shame because it is one of the best codes ever written for the ST. C'mon Dave and PC emulator folks; give us the ultimate computer by allowing simultaneous PC, Mac and ST modes in memory partitions.

953. The STE and Multisyncs

Newsgroup: comp.sys.atari.st
Date: 1990-01-27 22:08:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Jan27.170924est.58957@ugw.utcs.utoronto.ca>
Source record: 244297

The STE is supposed to support large screen monitors like the MONITERM 19" beast. My guess is that a message is sent to GEM telling it the resolution of the output device. Am I right? If so, if a call to GEM tells it that my output device (in this case my OMNIMON rainbow) supports 1024x768, does this mean I can put that many pixels on the screen. Please be kind with your replies, I am not hardware oriented.

If I can make such a GEM call, how do I do it?

>Does something like this exist for the ST? If so, are there special
>Unix requirements (sockets?).

The latest Atari ST implementation, with the hacks from the guys at Lachman Associates, is on terminator [35.1.33.8].

The Unix-Windows protocol was originally written to support the Mac. The Mac version supports a few features the ST version doesn't have, like Tektronix emulation. (That is, the Mac client. The Unix server works fine with either.)

To run the Unix side you need Berkeley sockets and pseudo-ttys. (Or a lot of patience to reimplement all of that under streams...!)

956. Need a hard disk guru -

Newsgroup: comp.sys.atari.st
Date: 1990-01-28 00:18:08 UTC
From: qralph@dna.lth.se
Message-ID: <1990Jan28.001808.15102@lth.se>
Source record: 244300

Hi,
Got problems with my hard disk. It is a Seagate 296N (SCSI), with ICD controller and software ICDBOOT ver. 3.41. Well - before I sometimes got a <Sense: $FF> and then it was shake, rattle, roll - suppose it recalibrated. But now I don't anymore, instead I get a <Sense: $17> quite often and trouble to read the stuff. What to do??? Scream?
Then some positive info: concerning OVERSCAN it is up in ver. 2.1 now, improving all the time. I could run TurboC and Calamus without trouble in it. It also comes with nice "photos" in STAD format how to make the hardware fixes.
Also - heard about the new shareware GEMINI-shell? It is up on version 1.1, some similarities with Neodesk, but quite a bit of differences too. It is GDOS-based. A couple of fonts to select among, also it is quite interesting because - well, you have seen these COMMAND shells, right? Well, it got one, which runs in a GEM window among the icons - neat!
Both of these I loaded down from the German BBS Maus Munster a night or two ago, tel. # 0251-80386. The GEMINI shell you can also get from this guy: Gereon Steffens, Elsterweg 8, D-5000 KOLN 90, Germany. They write (in the January issue of ST Computer, the shell is also described in the Feb. issue of ST Magazine) that he will send it if you sent him a diskette and a stamped envelope. I suggest you can be more generous and include a $10 bill or more, because it really is a neat thing!
BTW - the little Atari shop in our university town has sold at least a dozen STEs since they started to arrive in mid-December. What are you complaining about???

Can anyone supply a short example of working code which uses the 'start_timer' and 'time_since' functions? I've been playing around trying to time the execution of some code, but haven't been able to get a working program as of yet. (Probably due to a lack of understanding of the correct syntax needed). Thanks in advance!

BTW the program in question does contain '#include <time.h>', so this is not the problem.

959. Re: Technical Documentation (

Newsgroup: comp.sys.atari.st
Date: 1990-01-28 10:09:00 UTC
From: ron.sharp@canremote.uucp
Message-ID: <90012818034046@masnet.uucp>
Source record: 244203

The situation isn't quite as bad as my somewhat heated post made out. There are a number of books such as the Abacus ST Internals book (translated from German). The manuals with various C compilers are also quite good. However, it is questionable that new books will continue to be released which follow the changes in the ST line.

My prize piece of Atari documentation is the SRM Tackle Box, which is a large binder full of information. The Tackle Box is not made anymore however.

My flash of anger was sparked by the policy that registered developers are not allowed to devulge information. (Or answer techical questions on this network, I presume.) So that any non-Atari information is "discovered" by hacking around. I really doubt this cuts down on misinformation.

This seems to be a long-time Atari problem -- As I recall, the 8 bit Atari computers lagged behind for years because no one besides Atari had any information about the machine.

Down to my last minute of connect time. Better go now.

Message-ID: <4813.25c2dbce@uwovax.uwo.ca>
Source record: 244205

At work, I am pulling out 100 megabyte hard drives from IBM rt's to replace them with 310 megabyte units. This means that we have quite a few 100 meg. units sitting around that may be declared surplus. The drive in question is a standard IBM-supplied RT drive - model 0699. I am told that it may be an ESDI device. My local Atari dealer tells me that I should be able to hook up a controller/interface from Berkerley Microsystems. He tells me that the FaST unit from ICD is out of the question. Does anyone else have experience with this, or have any bright ideas. I surely would love to have a free, 20 microsecond 100 meg. hard drive to play with!

Thanks in advance

Source record: 244207

As has been mentioned, PC-DITTO II is currently shipping. Unfortunately, only a small percentage of those receiving their boards have had any luck in actuallygetting them to work.... The most common problem encountered is that the computer locks up after reading the boot sector of a DOS disk. Avant Garde is aware of the problem, and after much testing have concluded that the problem is not with the board itself, but is the result of timing problems between the 68000 in the ST and the V30 on the board. These timing problems are present only in certain STs and can most likely be overcome in software (which Avant Garde is currently working on). Those whom have had the good fortune of owning an ST immune to these timing difficulties (among whom I am unfortunately not to be counted) are very impresssed with the board's performance in terms of seed and compatibility. If any of you have received your PC-DITTO II boards yet, and have not been successful in getting it to work, the above-mentioned software update should be available within the next week, and with Avant Garde's permission, I would gladly post it on the net....

Also, if anyone is the least bit interested, I have recently modified my 40 track 5 1'4" IB Drive to work in both 40 and 80 track modes for the cost of about two minutes of time, and a dab of solder. The drive (a TEAC mechanism) is capable of formatting consistently at 82 tracks 10 sectors as well as standard IBM 40 track mode. If anyone owning a TEAC mechanism is interested in this mod, email me...

I really trust Revolver. It's nice not to have to be paranoid
when you run a piece of software ("... when will it crash..."). I find
that a lot fo s/w on the st is flakey. Revolver is a great product, I
think, and it should be doing better. It probably needs more
media hype.

I find shareware to be an interesting idea. It would seem a good way to at least get some kind of response from those who use your programs. However, I have never myself paid a shareware fee, although I have many shareware programs. The reason for this is that I have yet to find one I use even on an occasional basis. I keep them about so that I can get them to other ST people who might find them useful (a couple of the people I have given the shareware stuff to have sent in money). I do find it amusing that some authors seem petulant that not many people pay their fee. I don't think that they can *expect* people to pay. As for me, if the product is worth the money, it doesn't matter how it is distributed.

(good Euro/American ideas deleted)

>may have a chance. Gosh, what a long letter. Sorry pals.

Well, after getting my first programming degree, I looked all over for jobs (knowing I would still be attending school, I just wanted to see what was out there). It's basically a business programming degree, but I looked in newspapers from other cities, trade journals, scientific trade jounals, IEEE mags, and anything else I could find. I came to the conclusion that there were far more jobs requiring COBOL than any other language, and that those jobs were spread out so much that I could have gotten a job anywhere in the country I chose. A friend of mine working in California looked for me also, and seemed surprised that 'business'

programming and 'real' programming were totally separate departments in most businesses, meaning that if you sent them a resume you had better be more specific than saying you were a programmer. I found this amusing, especially since at his company all the programmers (of every stripe) got together anyway, despite what the company thought.

It isn't much help for world-wide cities, but a road atlas, such as that made by Rand McNally is a decent source of latitude and longitude information for U.S. cities (and Canada and Mexico). You should be able to get reasonably accurate latitude and longitude readings from the various maps in the atlas. I suppose that there is an equivelant source for cities in the rest of the world.

>Anyone know the coordinates for Sacramento, CA?

From my road atlas I get: 121deg30min W 38deg30min N +- 15min

If I spent a couple of seconds to actually use a ruler I could give you more accurate numbers.

wow, what version did you last try??? i admit that versions 1.2-1.5 had quite a few problems, but the last demo version posted (1.6d) was quite robust.

>I think shareware is a dead good idea, but I do think authors could make things
>easier for us users who are willing to pay. To wit, how are we Europeans
>supposed to get the dosh to North Maerican authors? Have you thought of that,

well, up until we went commercial, about 150 or so registered users of Quick ST (about 30% of registered owner) were from Europe (UK, France, Germany, Sweden, Norway, etc etc etc) and none really complained that there was no way of ordering from europe.

>eh? After all, Europe is the spiritual home of the ST, but NA is on the fringe.

a good point. that's precicely the reason we've gone to commercial marketing of Quick ST since we feel it's more than a match to that other screen accellerator (T* ST) and that europeans should benifit from having an inexpensive alternative to the overpriced screen accellerator that was mentionned earlier. we're right now in the process of getting a hold of some european distributors so we can get our product out to the ST world in as short a time as possible.

>I can write cheques in any European currency, as can most over here, but
>practically nobody can easily send money to America. The same maybe applies to
>americans wanting to pay for European shareware...

like i said before, it can't be THAT difficult since none of our european shareware customers has really complained like this before.

is there a reason that you guys across the pond can't get american dollars easily?? is it due to the european economic community?? fortress europe not allowing easy access to north american products?? there must be a reason. brits who have paid in pounds sterling have not caused us any problems. just a simple exchange at the bank gets pounds changed to dollars. is the reverse not true??

another effective idea is for europeans to register for shareware products in as large a group as possible (ie: 4 or 5 users at one time) this way the exchange costs are shared by as many users as possible, cutting costs for individuals, but again, you europeans should get after your governments to allow low cost exchanges between your favourite currency to american

dollars.

>Just a suggestion, but I think it's a good one. And I might even try Quick ST
>if I could try it first. After my previous experience I wouldn't touch a
>commercial version with a bargepole!

well, that's your opinion, but it would have been nice to say which version
you had problems with before spouting bad publicity. i hope your bargepole is a
short one! :-)

>Another problem; once in a while a double click on an appl brings
>up the show/print/cancel dialog box because the system does not
>recognize that a .prg file has been accessed. What the heck is
>going on with the new TOS????

actually, this seems to be a problem with TOS 1.4 as well, since it's happened to me a couple of times. double clicking on the file again usually gets the ST to recognize that the file is indeed a .prg, and run it appropriately.

on a related topic, has anyone with TOS 1.4 had this problem: the system sometimes boots up, displays the current windows and drive icons, and then for some inexplicable reason, erases all drive icons off of the screen. i can get them back by clicking on where they should be, but this behaviour is quite bizarre, and frankly, quite anoying at times.

You Shoulda gotten a MAGNAVOX 14" 8cm515 monitor...
2 years Parts/Labor included--standard warranty!!!

Has ANALOG-RGB, TTL-RGB, and COMPOSITE (I'm on my 124 now watching Cinemax
on my MAGNAVOX....)

640x240 resolution.....great for TV-useage via a VCR or as a monitor.

BEST PART: Only runs round $239.00 compared for what I hear mos dealers
asking for a 1224!

Just thought I'd mention an affordable alternative to the netbase....

I have an unused copy of Personal Pascal V2 for sale. I found my self doing most of my work in C or LISP. Three languages are too much for me to remember. From the little that I have used it, PP seems to be a very good package. Please respond via e-mail or call me at 206-789-7511 or 206-237-6034 if you are interested.

PS: I also have a Star NX1000 printer for sale for $125.

972. Re: Shareware Policy.

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 03:28:48 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Jan29.032848.2760@chinet.chi.il.us>
Source record: 244216

This is replying to a note including suggestions to make shareware better. I'm convinced that everyone who should pay for shareware means to pay for it. But it's always hard to send money into the unknown: even tiny amounts of money. Come to that, even ANYTHING. My personal reference is the port of umoria to the ST--I asked people to send me picture postcards for my trouble; perhaps 10 people have. And there's also my own feeling: I use a piece of IBM-world shareware that's about 6 years old. I can't believe there's still someone at that address.

I think the whole idea of shareware could use re-examination. If I write a program, and impressing people with what nice programs I write is a big motivation, then why should the admiring fans send me money? My payoff is in their using it, and I need them more than they need me. On the other hand, if AFTER impressing people with a nice program I have some goodie to sell, that's a different matter. Like I'm finally about ready to admit that there's no market for something I wrote. If it comes to that, I'll give it away, but if someone wants to know how the neat effects work, the source will be for sale. There are plenty of goodies to sell. Most shareware-type stuff doesn't need support, but some does (who'd want to get deep into MICRORTX without making sure David Beckemeyer would answer his questions?). An awful lot of shareware utilities are buggy at first: if something ALMOST works well, the first upgrade might still be shareware, but later ones might only go to contributors. The key isn't so much the need for the support, or upgrade, or source; it's the contact with someone. It's less like sending money into the void. And of course the need for the author to RESPOND makes it a lot more like work. Which is probably a key to something important.

One of the points in the GNU manifesto is worth thinking about: even if programs are freely transmitted, programmers still have something to sell.

Does anyone have, or know of, a program which will let you
create (relatively) simple line drawings and which will
produce as output (in order of preference)

1. PIC commands
2. an HP LaserJet
3. Postscript

I have a fairly serious need for this and appreciate
any pointers people can give; email replies preferred;
I will summarize to the net if there is interest.

Thanks,
john

The standard ST format is the same as the IBM format. The difference is the boot sector--IBM's don't recognize the ST boot sector, but ST's recoginize the DOS boot sector. So you format the disk, then write an MS-DOS boot sector onto it. DC Formatter, a PD format program which should be in the Usenet archives somewhere, can do this. Make sure you don't change the format parameters before writing the boot sector or you will get the wrong boot sector. Use double sided, 80 tracks, 9 sectors/track, normal interleave (as opposed to Fast interleave) and write the boot sector, and you should have no problem reading it on the ST or IBM.

>on this network, I presume.) So that any non-Atari information is
>"discovered" by hacking around. I really doubt this cuts down on
>misinformation.
...

A point of buiness in the information age (to use a cliche) is that information is a self-standing commodity independant of its medium that can be traded. The unique facet of information is that it is possible to sell one's information and keep it after the transaction. If this is prohibited in the original agreement prior to the transfer of information, then it is criminal. Examples of this are software piracy and intelectual piracy(plagiarism). But why should software be unique? I understand that the FSF folks do not beliece in private ownership of information, but can a corporation producing information products independant of public sponsorship subscibe to such a philosophy and stay in buisness? Doubtfull.

Before we wind up in a political discussion on the ethics of private ownership in general, I wish to make two assertions:

1) If an information product adds value to an enterprise, then that information product has real value and the source of the information has a right to reasonable compensation for that information.

An example of this would be a royalty paid to atari from Abacus for the right to publish dissassembled XBIOS, BIOS and GEM listings.

2) Atari is very strict about control of their information probably to the detrement of their product. Their choice, our loss. The non-disclosure agreement is neither novel nor rare in information buisness. It's the meat of all JOA's. If we as a community want better information at a cheaper price, then it is OUR responsibility, not theirs, to convince Atari that they should do as we wish.

Given, information ownership is a tricky subject, but it is neccessary for those dreaming of careers in information management (including academic jobs even on non-technical faculty) for us to have an under-standing of the economic foundations of our future livelihood.

Sinc,
Clark Breyman (presently a student of some sort)

This is why it's good to have a copy of the sources to dLibs, and keep them handy. timer.c, the module that defines start_timer and time_since, also includes the source code for two functions that call start_timer and time_since. For those who don't have the sources, here is the relevant module:

```
#include <time.h>

clock_t clock()
/*
* Return current value of 200Hz timer. This is the ANSI compatible
* timer function. The number of seconds elapsed between two events
* can be determined by calling this function twice and dividing the
* difference between the two times by CLK_TCK (200L).
*/
{
asm(" clr.l -(sp) ");
asm(" move.w #$20,-(sp) ");
asm(" trap #1 "); /* enter supervisor mode */
asm(" addq.l #6,sp ");
asm(" move.l $4BA,-(sp) "); /* save system clock value */
asm(" move.l d0,-(sp) ");
asm(" move.w #$20,-(sp) ");
asm(" trap #1 "); /* exit supervisor mode */
asm(" addq.l #6,sp ");
asm(" move.l (sp)+,d0 "); /* return system clock value */
}

clock_t start_timer(t)
clock_t *t;
/*
* Start a 200Hz timer. This timer value can later be checked with
* time_since() to determine elapsed time. These functions provide
* a very low-overhead way of timing events.
*/
```

```
{
asm(" clr.l -(sp) ");
asm(" move.w #$20,-(sp) ");
asm(" trap #1 "); /* enter supervisor mode */
asm(" addq.l #6,sp ");
asm(" move.l $4BA,-(sp) "); /* save system clock value */
asm(" move.l d0,-(sp) ");
asm(" move.w #$20,-(sp) ");
asm(" trap #1 "); /* exit supervisor mode */
asm(" addq.l #6,sp ");
asm(" move.l (sp)+,d0 ");

No, that's not what he said, and that's not the problem at all.

The floating-point problem stems from a version of dLibs converted for the Mark Williams compiler. The use of dLibs was an attempt to avoid a system crash that appeared to come from the MWC exit() function.

Michal wrote:

>Setting: Mega ST with TOS 1.4, gulam shell and MWC 3.0.6 compiler.
>Any program compiled with supplied MWC libraries which reads stdin.
>
>An attempt to redirect on a command line stdin to come from a file

>unusual manner.

This gets down to the issue of redirected file handles that has been mentioned recently in posts from Dale Schumacher, Allan Pratt and Ken Badertscher.

The GEMdos way of redirecting standard file handles, Fforce(), is unreliable at best and broken at worst. I've had all sorts of horrible things happen lately because of it, *including* running out of memory. On more than one occasion I've even been unable to launch coldboot.prg to slap the system out of its silly state.

Mark Williams uses a strange method of passing extended arguments that encodes redirection in environment variables. The child process then

handles any necessary redirection. The parent does not call Fforce() and then exec the child.

MWC's workaround requires that both the parent and the child know about the method and agree to use it. When you launch an MWC-compiled program with the Mark Williams msh shell, the parent and child agree. If the parent is not msh or running under msh, tough cookies.

Apparently gulam uses Fforce() to redirect input. There may be something in the MWC exit() code that pushes TOS over the (very narrow) edge. You might escape the grim reaper by calling _exit() or Pterm(). (Perhaps Dan Glasser can provide some insight?)

Dale and John Stanley and J. Bammi have been kicking around a really nifty (if you like black magic) workaround that allows the parent to cleverly change file handles around **in the child's context** just before the child begins to run. It appears to fix ALL these problems without requiring that the child process know anything about the method.

I'm not going to even try to describe how it works, but since kbad has more or less publicly blessed it, perhaps Dale or John will post some code.

I'm usually progamming in C, but sometimes I need to code some routines in assembler. As I am working with the MEGAMAX-C compiler this is very easy. Now my problem:

```
asm {
init: move.l #1234,A0
move.l #init,A0 ; this is not accepted !!!!!
bra init ; this is OK
}
```

Why is the second mnemonic not accepted ? Has anybody an idea how to use labelled adresses ?

I have not been able to get this to work either, neither on a Mega with TOS 1.2 nor on a 1040 with TOS 1.0. (I tried both colour and monochrome monitors if this makes a difference.) The Makeicon.prg worked fine.

There is a version on panarthea (if memory serves me right) which is supposed to be a version specifically for TOS 1.0 ROMs. However it was not uuencoded with Dumas uue and seems to have suffered some damage on its way to me, (the icons displayed by makeicon are screwed up).

So if anyone got icone working with TOS 1.0 could they please uuencode it with Dumas uue and repost it to comp.binaries.atari.st.

Thanks in advance,

Padraig.

philipp> so we cannot transfer the files by RS-232 direktly.

The Amiga can read and write MS-DOS and Atari ST format disks.
Commodore provides a PC-Utils program that can read/write IBM format,
but only to 5 1/4" disks. There is a free program called PCPatch
which patches the Commodore software to handle 3 1/2" disks. It comes
with a configuration file to read/write/format Atari ST disks, as
well. It has appeared on Usenet in the past, and is available from
the standard places with Amiga FTP archives, as well as the Fish disk
collection. If you really need help, email or post and I'll try to
email you the software (ack! I've revealed myself as a closet Amiga
owner!)

I do not believe it is possible to read/write Amiga disks with the
standard Atari ST drive, or at least I haven't heard of anybody who's
written a hack to do so. The Amiga uses a bizarre disk format in
which it reads/writes entire tracks of data at a time, with no sector
gaps. Most disk controllers choke on this format.

>

My wife had been playing CSB about 4 hours a day since we got it on Dec 22, and just finished it yesterday. She started out with a methodical approach to mapping (1/4 squared paper and 4 outliner pencil colors) and succeeded in mapping the entire dungeon as she went along. One hint was to watch your compass, particularly as you go up or down stairs.

At one point, she thought she had discovered a bug. Consulting the Oracle (she only it required twice, by the way) gave a hint about a situation with a pit; doing what the Oracle said didn't solve the problem. We decided to look at the various messages on GEnie service, and no-one had the same problem. It turned out she was carrying too much stuff. Throwing a lot of it across the pit lightened her party up a lot and she could move more quickly. It turned out the Oracle was right, but you had to be fast.

She reviewed all the solutions and hints from the GEnie forum after she had finished and came to the conclusion that the differences in the games played by many of the people were due primarily to the differences in the initial strengths and weaknesses of the members of the party. She started out with a party of just sufficient strength to complete Dungeon Master, while others on GEnie had used parties uploaded by someone else. One person said his party was to the highest level mastery in all categories and was having problems she never saw in her play. I think if she takes her current party (having developed skills during this game) back to the beginning, she may have a quite different adventure the second time thru.

The maps are quite complex but show the four dungeons do mesh neatly on all ten levels.

Best of luck, and remember, it just takes time. Be methodical, keep track of what's happening and map. Be aware there are occasional magic transporters in the dungeon (hint: the walls and/or floors don't move when you do). The puzzles are neat and always solvable, usually in more than one way.

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),

> Robert McCoy (Chattanooga Atari Owners Symposium)
> CS31217@UTCVM.bitnet

During a cold boot the ST will try to configure the MMU for the
type and size of memory installed. If it detects an error in the
second bank of ram it just assumes that there is no memory there
and configures the MMU/GLUE? to not send the CAS to the second bank
and uses only the first. Even if you try to access the second
bank by generating the addess in a program such as a ram test no
CAS will be issued.
About two years ago I did a home brew 1 meg upgrade to my ST and
had the same problem. In going over the BIOS code I figured out
how to configure the MMU by writing a value to it to force the
recocnition of the 2nd 512 kbytes while still having the machine
think it has only 512 kbytes of RAM. I then wrote a memory test
program to write this (or any user input value) to the MMU and then
test the RAM. I wrote several tests, the usual battery of memory
tests, incluing 1's 0's, AA'a 55's, and walking 1 and 0 bits but
it didn't find any errors! I then studied the method the BIOS used
and wrote a simular test. Guess what, it found a bit error in
one of the 256K chips. I replaced the chip and I had 1 meg!

If you're interrested, I can send you the code. I'll give you the
binary and source if you'ld like. The source is written in Alcyon
assembly (standard motorola style). Let me know and I'll send it
to ya.

>because - well, you have seen these COMMAND shells, right? Well, it got one,
>which runs in a GEM window among the icons - neat!

I saw this up on GEnie the other day and downloaded it. It doesn't seem to work with TOS 1.0, so I can't comment on its utility. The documentation was in German (naturlich), but wasn't difficult to follow, even though I've only had the equivalent of 2nd year college German -- and that a good many years back. If I read correctly, you need at _least_ the Blitter TOS (1.2) in order to use the program.

The files in the ARC take up the good part of a double-sided floppy disk.

Uh, I hate to break this to you, but SOMEbody just realeased a two-deck model.
I can't remember the brand name, but I remember reading a small article about
it just last week...It's out there and available.

As for the copy protection of video cassettes, I had trouble viewing a couple
of movies that I bought, because of the copy protection. I took them back and
they worked fine in the store. They say I need to have my machine serviced to
get the tapes that are copy-protected to work in my machine. This means that
copy protection of video cassettes WILL cost some people money. I can watch
ANY non-copy-protected tape I want...

>suggestion for a replacement?

>As far as I know, the original cable uses a 75 Ohm coaxial connection
>for the video signal and 5 shielded leads for the rest. Is that true?

>Thanks!

>Michael Ritzert
>mjr@dmzrzu71.bitnet

I did build a monitor-switch-box with one Atari-monitor-plug on one end and two Atari-monitor-sockets on the other end. The cable has only one shielding around the bundle of wires. The cable is about 1 meter long. The picture quality is so good as it was. I have connected all 13 pins to both of the two sockets, which are connected to a SM124 and a SC1224. I only interrupt the monitor-sense-wire for switching between color and monochrome.

But be warned :
I also have a longer cable (2 meter) with on monitor-plug and one monitor-socket. I only works fine with the SC1224, but with the SM124 every black pixel is transformed into two black pixels. So all text looks bolded and the desktop-grey becomes black. The cable has also one outer shielding.

Conclusion:
75 Ohm cable is not needed, if it not to long.

994. Metacomco, Lattice C and Cambridge LISP.

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 15:18:11 UTC
From: gjh@otter.hpl.hp.com
Message-ID: <570054@otter.hpl.hp.com>
Source record: 244238

Metacomco have given up their activities in the software market. In consequence their software is now "lost to us" --- that apparently includes Cambridge LISP.

As far as Lattice C goes, Lattice are a U.S. outfit, with whom a U.K. outfit (HiSoft) have collaborated to produce a new version of Lattice (v5), marketed in the U.K. by HiSoft themselves.

Hisoft are of the opinion that as Lattice is a U.S. operation, the U.S. side is probably Lattice's province. I haven't any suggestions how one might track them down. If there are difficulties, I could ask HiSoft if they would contact Lattice to see if Lattice are prepared to reveal their U.S. address.

In the U.K. Lattice V5 is now available from Hisoft and here I quote:

"Lattice C ver. 5

* Completely new version developed by HiSoft & Lattice
* Full ANSI-standard compiler and libraries
* Generates fastest code ever (> 2000 Dryhstones/sec!)
* Choice of fully integrated environment or CLI (supplied)
* Comes with Compiler, Linker, Assembler, Editor, CLI, WERCS, Global Optimiser, ST Libraries, full manual etc."

and

"ex-Metacomco Customers

As some of you already know, Metacomco withdrew from the software market earlier in the year, leaving many people with old, unsupported products.

[...]

* Upgrade MCC ASM 12 to DevpacST 2.08 for only #39.95
* Upgrade Lattice C version 3 to the brand-new Lattice C for only #59"

(# = pounds sterling, price includes U.K. Value-Added-Tax (15%) and Postage & Packing within the U.K.)

(presumably, return of original disks and manuals required)

Sorry about the apparent "commercial" for HiSoft, but I'd rather not misrepresent/mislead anyone. You could always try contacting HiSoft direct on +44 525-718181. They're a reputable, friendly and co-operative outfit, I've had no problems in any of my dealings with them --- and I'm not connected with them in any commercial sense other than a satisfied mail-order customer.

Hope this helps you Lattice owners out there. Apologies to you Cambridge LISP owners.

Source record: 244239

Hello world,

I discovered a serious bug in the archiving utility Ar coming
with Sozobon C. It is not possible to add an object module
larger than 64 KByte to a library.

A (very) short look at the source code delivered that this must
have something to do with the 'lseek'. Then I tried to dig
deeper into the problem and wanted to trace it with my Laser C
source code debugger. This required a recompilation.

Well, it turned out that an include file AR.H is missing, and
this is the reason for this article. Unfortunately I do not
have the e-mail address of Sozobon, Inc. to report my problem.
But perhaps *you* have AR.H and are able and willing to mail it
to me.

Thanks in advance

996. Re: Shareware Policy.

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 15:43:37 UTC
From: davidli@umn-cs.cs.umn.edu
Message-ID: <1990Jan29.154337.26580@umn-cs.cs.umn.edu>
Source record: 244240

In article <1990Jan29.032848.2760@chinet.chi.il.us> saj@chinet.chi.il.us (Stephen Jacobs) writes:
>My personal reference is the port of umoria to
>the ST--I asked people to send me picture postcards for my trouble; perhaps 10
>people have.

Stephen writes cogently about the Shareware issue, so I wanted to address a few points which he didn't take up.

First -- although a given shareware program may be downloaded by thousands of people, the actual number who use the program with any regularity may number in the tens, or if lucky, the hundreds. For example, I have downloaded (at one time or another) many shareware programs. How many do I actively use? None. [For Stephen -- I may have downloaded it, but only to reupload it to a BBS where people more interested in playing the game might get a look at it. I don't even have it on an archive disk...]

Secondly, there are a number of programs out there that are priced out of their market. I don't use Charles Johnson's ARCshell because he wants $15 for it. It's as easy for me to type

```
% arc -x archive.arc *.*
```

as it is to fire up the program. I don't use Pinhead for much the same reason -- the utility of the program _to_me_ (your mileage may vary) is not worth what he wants for it.

Finally, there are some programs which do not work well, or which conflict with other portions of my system. For example, I don't use the QuickST speed enhancement because it produces weird ghost cursors in MicroEMACS and other such behavior when used with some non-GEM programs.

I _do_ have several shareware programs under consideration. However, the shareware programmer/author should be aware that the time between download and evaluation may be _months_ or _years_ rather than weeks. For instance, the two main programs I'm considering at this time are Opus 2.2 (I've used a spreadsheet on the average of once per year for the past 3 or 4 years ... and it's been on a minicomputer at work), and a GDOS-based documentation program whose name escapes me at the moment, but it is supposed to print 5 1/2 x 8 1/2" pages sideways. The latter will probably get used once or twice within the next month to see whether such documentation printing is worth the time and effort as opposed to just printing out ASCII text.

I do maintain a large set of archive disks. No doubt there are copies of the ARCshell, Pinhead, QuickST, and other shareware programs on those disks. The reason -- there may come a time in the future when I want to pass a utility along to a friend who might benefit from its use, or there may come

a time in the future when I might be able to put that certain utility to good use myself.

-- David Paschall-Zimbel

By the way ...

I was very pleased with the 'freeware' release of DCShowit from DoubleClick. It's a good quality program which works nicely the first time. As Stephen mentions ...

>... On the other hand, if
>AFTER impressing people with a nice program I have some goodie to sell, that's
>a different matter.

Releases such as DCShowit, which is useful in its own right, make me more amenable to considering other programs, such as DC DeskTop when it arrives.

When a partition is "initialized", the file management areas are set to a
correct initial state. While the Spectre formatting of a partition runs too
fast to be erasing the data storage area, it surely is ovewriting MACS
version of FAT and Directory.

I previously made available to those interested a stand alone partitioner
and low level formatter. The partioner will allow you to create, a new TOS
partition where you overwrote it. But it will have no files in it.
It is possible to anylize the partition (memfile or SUPRA EDIT) and identify
chains of ASCII text that you could recover. Binaries are pretty bad.

Perhaps Dave will have better news for you -- I doubt it. I will mail the
partitioner of you send email.

>zero results and my Sams Computerfacts on the 520 are no help. Would
>anyone who's had experience mounting these things please tell me the
>obvious thing I'm missing.

Well, since no one replied, I figured it out myself and now have a 520 boasting not just channel 3 but also a seperate NTSC/PAL output with audio.

The basics of the device is a motorola 1377 NTSC/PAL encoder with a custom Matsui channel 3/2 modulator. The 1377 is fairly complete with the exception of the chroma-burst ocillator which, for some reason, is supposedly generated by an unpopulated section on the 520 motherboard near the shifter chip. That's what the two extra wires are for. They turn out to be completely unnecessary however as the modulator board does come with the spots for the colorburst crystal (3.58 mHz) and the adjustment capacitor (variable 30pF). Both are radio shack available. Mounting is 5 min with a soldering iron (including warm-up time) and adjustment is made by running a color screen and adjusting the variable cap until the color is right.

One thing I did have to do (because I've re-mounted my st into a larger box with drive and everything enclosed) was to run a 7 inch extender bus on the connectors to the modulator. This made experiment and adjustment very easy. I used normal ribbon cable with alternate grounds to cut down on cross-noise. No problems with the exception of the power pins; the modulator needs both 12 and 5 volts and, for some reason, my 520 did not provide these on the modulator connections. I tapped pin 14 on a 1488 for the +12 and a bypass cap for the +5.

I found that the 1377 chip has a high current drive output (pin 9) which is directly feedable into a 75 ohm load through a 100ohm resistor. This connected to the classic rca jack means you can run high quality NTSC images straight into a VCR for animation purposes (very possible with the proliferation of 8mm and SVHS decks with flying erase heads. Anyone

recommend a really good animation program?). The 1377 also has a pin which selects either NTSC or european PAL format. A simple switch gives you access to either although for PAL you do have to change your scan rate to 50 hz.

Oh, and to answer my own question, the 74ls86 is to kick start the chroma transformer into purity regardless of temperature. Either the transistor or the 86 version work fine but color bleed is more restricted on the 86 version.

The audio is straight from the atari with a 15uF capacitor to act as a decoupler. This can be picked off one of the three pins feeding straight into the modulator section on the pcb. One is power, one is NTSC signal. Backtrack to find sound. Feed also into an rca jack.

The one adjustment on the ch3 modulator section is volume control. Adjust until your tv sounds right to you (remember to check with normal tv levels first).

All in all, it's a beautiful all-in-one module. I had to pay $60 canadian for each of mine (from an Atari corperation tech-type) which means they're only $30 stateside. It's worth it though. Saved me a lot of work making my own. The nice thing is that there's no reason why these same modules can't be used on PC's or anything else that generates RGB and Sync.

My next step is to figure out how to make a this st gen-lock. Done entirely from hardware, there won't be any of this software fiddle-faddle. I want to be able to run Uniterm or Degas over top of "married with children". Imagine reading news and watching tv at the same time. I've done it with a gen-locked 40 char terminal and it works fine. Very addictive. An 80 col st will mean media-glut unlimited.

Remember; the best reprogramming is done with a soldering iron.

I'll let you know.

1001. FTP to the States from the UK?

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 17:13:39 UTC
From: n-waters@NIMR.MRC.AC.UK
Message-ID: <9001291713.AA04944@nimsn41.>
Source record: 244245

Has anyone from the UK (or the rest of Europe), FTP'd PROG_A16 if so how do you accomplish this? I appear to be able to get to earn-relay (UK), although not the request for a password. I can also successfully ftp via JANET using hhcp, although I am not sure this is true ftp.

Any help gratefully recieved,

Nick.

1002. Tape Drive Backup

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 17:15:50 UTC
From: alex@athertn.Atherton.COM
Message-ID: <17425@laurel.athertn.Atherton.COM>
Source record: 244246

I got so many queries regarding this information, that I thought
I general posting would be of value.

The system in question is available from Berkley MicroSystems, in
Berkley, California. It uses a standard size Un*x style cartridge
tape mechanism and tapes (unlike the ICD unit, which
uses a non-standard size) to allow you to backup/restore your
hard-disc partitions on a file-system basis
(there is no image backup yet). Tape cartridge prices run about
$15 each (less if you go to swap meets, where used Sun Microsystems tapes
can be found for as little as $5). Disc to tape speed averages
about a meg a minute, which means that the average 10 meg partition
can be backed up (assuming it's completely full) in roughly 10 minutes.
One nice thing is that the backup doesn't need to be monitored,
so you can be off doing something else while your hard disc gets backed up.
(Like sleeping...:-)

Berkley MicroSystems will sell you a complete system (tape drive, controller,
SCSI<->ASCI board, software) for $650. However, they say that since the
cost of the tape drives mechanisms is so cheap, you can probably do a
lot better by going out and buying a used tape drive yourself, and
just buying from them the controller card (which is apparently
the difficult item to get ahold of [I think their price is $100])
and their SCSI<->ASCI board [~$150] (if you need it).

One caveat--you will need some technical expertise in order to put
this system together. While SCSI stuff is pretty much plug and play
these days, there is still a certain level of knowledge needed in order
to prevent yourself from frying expensive components. (This is not
a 'take it out of the box and run it' type system, you will have
to get your hands dirty and assemble it.) Given that
caution, if you're in the market for an inexpensive tape backup,
Berkley MicroSystems is definitely worth a look. You can reach
them at (415)-547-2191.

Is the documentation in English? Does it have a GEM interface? If so, are
the dialogues in English? I was under the impression that an English
language version of Turbo C for the ST is not available.

1004. Strange (?) Problem, need help!

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 17:42:46 UTC
From: O12@psuvm.psu.edu
Message-ID: <90029.124246O12@PSUVM.BITNET>
Source record: 244247

Hello Everyone,

I have a rather strange problem, I have written a GEM application which uses AES and LINE-A calls, and suffice it to say, it runs perfectly fine but has trouble exiting to the desktop properly and displays 3 bombs.

The really wierd thing is the application runs and exits fine when launched from a shell other than the desktop, but then causes the SHELL to crash when you try exiting it to the desktop with 3 or 4 bombs. Other programs can be launched from the shell before exiting it without error, the shell only crashes upon attempting to exit to the desktop.

I did use rsrc_free() and appl_exit() to cleanup before exiting, and I do not use any windows, only a menu bar and dialog boxes. Any ideas ?

Thanks for your time..
-JtK

1009. Re: reserving memory

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 18:42:22 UTC
From: jg@hpldola.HP.COM
Message-ID: <11830072@hpldola.HP.COM>
Source record: 244249

Thanks to Alex and Derek for their insights, and I agree that malloc()ing all of the memory is a no-no. But I'm still a tad confused, let me state the problem another way:

Let's say my application is loaded, wakes up and says, "I wonder how much memory I can use". It goes out and does a Malloc(-1L) to find out how much available memory the OS has. Then it says, "I want all but 50K".

How should the application accomplish this?

Ideas:
1) malloc() (or Malloc()) all but 50K of the available memory and manage that chunk of memory itself. I just can't believe this is necessary, shouldn't malloc() be able to do this (see #3 below)?

2) Malloc(50K) before any call to malloc() then Mfree() that 50K right after the call the malloc() to keep 50K always free for the OS.
Yuck!, but could be workable on a single tasking OS.

3) set some switches so that malloc will never take the last 50K of memory from the OS. This seems preferable, but I don't know what the switches are for MWC (or any other compiler for that matter).

Thanks for any help with this problem.

>work-around for most of the redirection problems.

>I'd be willing to post the technique to the net, but I would like to get
>confirmation from Allan or Ken that the "Pexec/H-blank trick" will continue
>to work in future TOS versions.

I can't dictate what techniques you use, and I can't repudiate existing documentation: we've guaranteed that Pexec will always start the new process at IPL 0, and therefore you are likely to get an Hblank interrupt between the RTE from GEMDOS and the first instruction of the new program.

How you use this is up to you, but I warn you: the lure of the Dark Side is powerful, and once you start down that dark path the forces of Evil will claim your soul.

Yes, Fdup / Fforce will gag when you get too deep, but Hblank is not the answer. If you want to link programs with temporary files, great! Add command-line options to each program in the chain which say, "Use this file for input, that one for output." I had hoped that J.Bammi could win you over to this point of view.

>and Amiga Disks with the Atari ST ?

DOS-2-DOS from Central Coast Software allows an Amiga to read files from an Atari ST disk or MS-DOS 3.5" 720K disk, using an existing Amiga drive. You may copy files back and forth, read directories, and possibly even display text files from any of those formats. They also have a different product, Mac-2-Dos which requires a Macintosh floppy drive to read their funky format...

Central Coast Software
424 Vista Ave.,
Golden, Colorado 8040
(303) 526-1030

DOS-2-DOS lists for $55US, and Mac-2-Dos is $100 ($350 with drive).

I'm not aware of any software to read Amiga disks on an Atari, but there may well be...

>
> Dave
>
> /|\ | seattle@hydra.unm.edu <> Dadams10@GEnie <> David G. Adams \
> < |/\ | LotE | "Modern love is automatic" - A Flock of Seagulls |
> \| | Live it! | Don't bug the University 'bout nuthin' I've said. /

i format my disks with the normal FORMAT command of the ST (doesn't matter which TOS version) or with the FORMAT of the PC. After I have done this, I change the first three bytes 00-02 of the bootsector to <EB 34 90> and the media byte at 21 to <F9> with a diskmonitor on the ST or on the PC. That's all that I have to do.

I have got this idea from the german computer magazine "c't Zeitschrift fuer Computertechniik" of June or July 1989. I work with this method for more than six months and I never had any problems with my disks except booting them on the ST, but this is not of interest cause I use these disks normally for file transfer.

Using these disks I transferred all my programs form the panarthea server or the PROG-A16 list from the PC at work to my ST at home and I never had any trouble with the programs.

Subject: FIREWORK available on net ?

By the way, does someone have a compilede version of the program <FIREWORKS> form the german ST COMPUTER magazine, October 1989. I typed this program into my ST and used an old version of the Megamax C compiler, but I couldn't get it to work. Can anyone send my a encoded version of the running program ?

Thanks

Hermann

Hi,
I've got a spare 3.5' internal drive for my 520 ST which I want to rig up
as an external drive. I've managed to get the drive accessing, but the
computer is giving me an error message when it does, the message is something
like : 'Drive not responding ..'
If anyone has any info which could be of help, could they please mail me.
Thanks,
Steve Strong - the man with no signature :-)

1019. Atari 520ST for sale

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 22:29:19 UTC
From: movold@agnes.acc.stolaf.edu
Message-ID: <11060@thor.acc.stolaf.edu>
Source record: 244119

I am selling all of the following for $575.

Atari color 520ST with ss drive and original TOS in ROM.
Panasonic KX-P1091 printer.
About 50 disk, most of which are STart and Compute magazine disks
and various digitized things.
Other miscellaneous things such as joysticks.

If you don't want the printer, subtract $100.

I think this is a good deal, but if someone thinks it's either too
high or too low, let me know. (Even if you don't plan on buying it)

I will not be able to reply until about the 8th, since I am going on
a vacation.

1020. Text->PostScript or PostScript driver/converter wanted

Newsgroup: comp.sys.atari.st
Date: 1990-01-29 23:16:58 UTC
From: cwilliam@brillig.umd.edu
Message-ID: <CWILLIAM.90Jan29181658@brillig.umd.edu>
Source record: 244121

I have unlimited access to several PostScript and dvi printers at work
and am looking for a way to convert PIC files and/or EPSON compatible
text files (i.e. the ESC-codes to turn bold on and off are in the
text) and/or screen dumps to a PostScript file for later printing.
What would be ideal is some sort of DA that would sit in the
background and capture junk from the printer port and somehow crudely
convert the port's output to a PostScript image and store it to a
file.

Is there anything like this?

Blitzkrieg ('tanks in advance),

Chris

> -JtK

After you call rsrc_free() and appl_exit() , exit the program via
_exit() rather than exit(). This should solve your problems, it seems that
TOS gets confused if it attempts to cleanup a process that's already been
cleaned up.

Subject: gcc problems

I just installed the gcc1.36 which I got from dsrgsun and tried to build ctex (initex). It soon turned out that gcc1.36 is not able to compile this stuff on the ST. Even at the first module, align.c, the error message "virtual memory exhausted" appeared. Switching off any optimizations didn't really help: the same error message appeared in the module "cmds.c". Playing around with the stacksize wasn't successful, too. I used an old gulam, no memory resident programs or accessories at all. All auto folder programs have been disabled, including tos14fix, to ensure it isn't a conflict with anything of my standard configuration.

Gcc1.34 is able to compile this routine but only when the optimisation is switched off. I guess this is a bug in the library. I had similar problems when I recompiled gcc1.34 with itself. It was possible but the newbuilt compiler could only compile small programs (same error as above). John Dunning told me that alloca would fail due to a bug in qmult which I thought has been fixed in the meantime.

Simple lack of system memory can't be the reason --- replacing my ST4 by a ST2 reproduced the error at the same point.

Interestingly, the Unix based cross-compiler seems to work correctly...

Has anyone fixed this in the meantime? I have lots of trouble with ftp (via bitftp to a vm host, uploading across a strange serial conncection with an ibmclone since neither uniterm nor ckermit work with this connection, then transferring everything to the ST is an annoying procedure, and it takes weeks to fetch the stuff). So is someone willing to mail me the fixes, please? (needed: fixed gcc_cc1, fixed lib and diffs for the lib sources.)

A few other bugs: contrary to the readme.st, the stacksize of gcc_cc1 was 128K instead of 1M. 1.34 usually runs with 0.5M.
I don't trust the utilities to manipulate the stacksize since they are buggy.

fixstk 524288 gcc_cc1 resulted in a reported stack size of 51K !!!!!!

I had to specify 10 times the amount of memory I wanted to have in order to get a correct report. So either the input or the output conversion routine of the library is broken.

Again, please help me since I don't have the time to dig into the library stuff (and lack documentation) but need a compiler I can trust.

Thanks for any help,

Michael Ritzert

| Arc 6.02 is the first program I called from Arcgsh
| that supports xArg. (Zoo claims it supports xArg but it does
| not.)
I believe Zoo supports ARGV, which is the officially supported
extended argument standard. The README.ST file said it supports
"xARGV" (whatever that means) "as supported by CRAFT/GPshell,
gulam, msh..." Gulam and msh definitely support ARGV.
You should too!

| (Still missing: Sources for Arc 6.02 to get it to work on the
| UNIX machines.)
Judging from what I know about the Arc 6.02 port, it wouldn't
help much to have the sources. The individual who ported it
is a speed freak, and probably hacked up a lot of it in assembler.
If not, I congratulate him for learning the beauty of portability :)

As you may remember, sometime early December 1989 a (Mono only) game called Patience appeared in comp.binaries.atari.st. For those people who found their enjoyment of the game dampened by the fact that the docs, menus, dialog boxes, EVERYTHING were in German, I have edited some of the binaries and replaced German text with suitable english text. Those persons who are interested in getting the modified files (Patience.prg and Patience.rsc) can write to me and I'll send them out. (If many people respond, I'll see that they get posted somewhere.) Please make sure that your complete e-mail address is included.

> and Amiga Disks with the Atari ST ?

I have both an Amiga and an ST and you can read and copy ST disks on the Amiga with DOS 2 DOS and Project "D". However reading and writing Amiga disks on the ST is another story. I have the Discovery Cartridge on my ST. It claims to copy anything...Thats Bull though. It can't copy a simple Workbench disk from the Amiga. I was very disappointed in that. I know of know way to copy Amiga disks with an ST. If anyone knows of away, I'd be interested.

On the Amiga side you can get CrossDos by Consultron, Inc. (avail for
18.95 mail-order from CompuAbility) allows you to read, write, format
and mount MS-DOS and Atari 3.5" disks. I have had no problems with it
working on MS-DOS format, but have not tried Atari.

I have no connection with Consultron except as a satisfied customer.

Yes, it's called "Pyro"

It creates a firework display on the screen which is better than
the just plain 'black' screen savers which I have been told could damage
analog RGB monitors because of the sudden loss of signal. The analog
monitors thinks that it has lost the signal from the computer, the
'pyro' display turns the screen to black and sends fireworks out to give
the screen something to do so it protects the screen both ways.

Bob

P.S.
The damage is caused over an extended period of time.

1034. TeX program suite status (query)

Newsgroup: comp.sys.atari.st
Date: 1990-01-30 06:21:35 UTC
From: csrobe@icase.edu
Message-ID: <1990Jan30.062135.15873@icase.edu>
Source record: 244150

I am running TeX and LaTex on my 1meg 1040 ST and I'd like
to see where we are.

I have the version of TeX that was distributed some time
ago. (I believe it is the C version that was compiled by GCC.)

I am more interested in the status of TeXShell and DviST.
The TeXShell that I have does not allow chaining to your editor,
but as I recall it was to be forthcoming. Did this ever
materialize?

As for DviST, I have the GEM version 3a.3 that has bugs, quirks,
and other unusualaties associated with first-time GEM programs.
(For example, it cannot be called from TeXShell.) Has this program
been updated?

In using DviST and DviDsk, I seem to be limited to roughtly 8.5x11"
paper, even though TeX allows for larger sizes as well as does my
DeskJet. Does anybody know if these programs have been updated to
handle larger page sizes e.g. 8.5x14"?

Finally, I am trying to compose a 11pt document with a san serif
\footnote font, but DviDsk says I don't have it and prints nothing
for those chars. In general, I often (always?) get complaints about
my fonts from DviDsk about my fonts. For example it says it can't
find
cmss8 mag 1500
cmr10 mag 2592
cmbx10 mag 1800

and that it is using the nearest neighbor or nothing at all.
I basically have the fonts that came with the original Tex,
DviST, and DviDsk distributions. Can somebody help me get a
commplete font set. Ideally, I would appreciate a pointer
to a brief tutorial on understanding, building, and using
TeX fonts. I would also appreciate a zoo archive of a
complete (what-ever-that-means) font set.

I guess that is enough for now, thanks in advance for any help
in these matters.

cheers,
-chip

There was such a beast on one of the last ST-Log disks (I believe it was the month before it's demise), but I was not too impressed with it. It was rather primative, and does not really show the ST to be the kickass graphics machine that it is (IMHO). I would love to see some really good screensavers (perhaps worms crawling over the screen, or some fireworks with arcing trajectories), but I have not the programming skills to produce one. The source was included in the magazine, so perhaps someone could snazzy it up?

From: mfolivo@sactoh0.UUCP
Message-ID: <2494@sactoh0.UUCP>
Source record: 244155

Without dragging my system to a computer store, I have pretty much decided on either an Epson LQ-510 or a Panasonic KX-P1124 24 pin printer.

My question is if the LQ-800 printer driver that is included with Microsoft Write works with either of the two machines. I use GDOS, and would like to use the fonts that are used in Write.

Are there specific drivers for either LQ-510 or 1124 out there, that are compatible with GDOS?

The Epson, of course, uses Epson codes, but is the LQ-800 driver compatible? The Panasonic has LQ-2500 emulation, is it compatible?

I prefer the features of the Panasonic, but if the Epson works better with the WP and system I have, then Epson it is.

Or can someone recommend a low-cost 24 pin with similar capabilities?

By the way, I primarily use the Dutch font.

The number of bombs represents the number of the exception that occurred.
See the Motorola manual for full details, but for example, 2 bombs shows
a bus error (if memory serves me correctly) because that is exception 2.

This morning, I received a letter from Softpaquet, officially announcing the death of Aladin due to an Apple lawsuit. The planned 128k update and the remaining printer drivers will not appear.

Well, this makes me anxious to hear something from the person who wanted to make a shareware Aladin. Has he come to any conclusions yet ?

Hans

What's mythical about an STe? I bought one last week for 1500 DM. Although
it (not me!) killed its monitor instantly everything's fine... In fact, I
couldn't get a STFM! Now all I need are infos about the new features of the
STe, including larger memory, 68020/30 support, colors, sound etc.

Hello,

I wanted to get some files from the archives at panarthea and realized, that they
are all uuencoded and arc'd. We don't have arc/unarc on our system and I don't
have a version for the atari either.
Can somebody please mail me a copy of the source code of arc/unarc and zoo, which
is running under Unix preferably on a Sun4 running SunOS4.03 and which is not
compressed using arc or zoo. Or if it is available via a mail server please give
me a hint, from where it is available (Note: we don't have ftp access to the
internet, only mail).

Please mail any replys directly to me, since I'm not following this list regularly.

Thanks a lot for any help

When the ST puts up those cute little cherry bombs, it also writes out the error number and register dump (and I think part of the stack) to an area in memory which can survive a reset. There is a program in the archives called POSTMORT which will access this memory, tell you in English what the errors were, display the registers, etc. It also comes with a set of short binaries to generate most of the errors.

Hello,

Does anybody have any experience with ST-speed ? Preferably in a Mega 2.
Which programs do run and which don't. Is it fast ? No problems
with the graphics interface ? Can you use the mouse and if yes,
with which packages ? Did you try extended memory (should work in
the newest version) ?

Please respond via mail, if there is enough interest I'll summarize.

Thanks in advance,

Remco

Thanks, a lot!!

I appreciate your efforts.

I can send you a copy of my RSC/HRD files which keep getting corrupted.
Can you post a MAIL address (international mail or someothing)
so that I can send my disk back to HiSoft.

Also, is the USA version identical to the UK version of WERCS?? Or does
that fact that I am using a USA version of TOS have anything to do with it?

I have the same problems with both TOS 1.2 and TOS 1.4 (USA version again).

Well, I do thank you !!!!

>
>Further, most dealers have no-return policies because they think too
>much like you- that nearly everyone who returns a product that sucks
>has in fact copied it and will distribute it.

I will dispute you on these points. A friend of mine and I own an ST-only store. I have many contacts with other dealers both in this area and across the nation. (Yes, Virginia, there are still a few dealers out there. :-) Every dealer with whom I have ever worked does demos in the store. Perhaps you are just in a "bad" area, but I think I probably have far more contact with other dealers than you have, and I would say that at most 10% of the dealers do *not* do software demos. However, I will say that I am not counting mail order places, because in that respect, you get what you pay for. One of the reasons dealers generally charge more is the time and product overhead of doing demos. I know we've had folks come in and try out various products for a couple hours before they decide whether they do or don't want it. That's a long time to tie up a salesperson and a machine.

Before we became an authorized dealer, we still did demos. There are very few places that are software-only, and most of those are mail order places, so once again, your dispute fails to hold its own ground.

Your third point touches on return policies. Returns are a difficult thing to guage, however, we generally accept them for a store credit. However, if the same person tried to return just about everything they bought, we would indeed think twice. If a dealer knows his software, he probably has very few packages that "suck". If a dealer knows his customers, he can make recommendations on packages that will suit the customer's needs. That's why you pay a dealer... for information as well as for a product.

>Please, if you're going to flame me about economic infeasibility and
>how the market would simply shrivel up if dealers accepted returns in
>lieu of doing demos, at least concede that one point- that most

>programs in most places cannot be demoed and the buyer is, in effect,
>buying blind.

Caveat emptor. Let the buyer beware.

If you are in an area where there is no dealer, learn to read... magazines,
the network, information services, bulletin boards... there is no dearth
of information available to the user who is truly interested in finding it.
In the Age of Information, there is no excuse for buying blind except
perhaps laziness... and stupidity.

>are more organized is truly suffering from major delusions.
>

Sorry Chris, ask ST developers if they think they are suffering
from major delusions. There are two factors to consider:
(1) The ST has a *very* small user base compared
to the IBM or the Mac. A 25-30% theft ratio
means a lot more lost revenue to the ST developers
then the same ratio does to an IBM developer.
(2) The Atari communities theft ratio is higher than
any other platform. (40-50% based on a two year
old Compute! article.) There could be many reasons
for this...my personal theory is that the Atari
community sprung (somewhat) out of the old
8 bit Atari community, where game theft was
rampant. Perhaps that philosophy held on into
the ST community.

(Sorry to all those who think this thread doesn't belong on this
group, but I believe it does - and I think its an important issue.)

> The future lies ahead... and behind us lies... lies... lies.

On the subject of cartridge port interfacing, I am currently working on
something that someone else may wish to build.

I have designed a method of putting 1Meg of DRAM on a small PC board that
plugs into the cartridge port. This amounts to a very easy to 'plug-in'
1MEG RAM-Disk.

By using the large amount of available address bits as input, I am able
to do two 'reads' to supply the 1MEG address. The first read supplys
the ROW address (10 bits), and the second read supplies the COLUMN
address (10 bits). These values are latched so that a PAL on the board
may perform the actual read of memory, after which a third read can get
the data. If the operation is a write, data must be supplied before
giving the ROW and COLUMN addresses.

Let me know if anyone is intertested in schematics for this project.

gilliam@lowlif.dec.com writes:

| Is the documentation in English? Does it have a GEM interface? If so, are
| the dialogues in English? I was under the impression that an English
| language version of Turbo C for the ST is not available.

The version I use has German documentation and help files, but English text in the menus, dialogs and compiler error messages. Version 1.1, the one currently available from Borland in Germany, comes with a GEM based shell which includes the compiler and linker and a decent editor. It also includes .TTP versions of the compiler, linker and librarian. An assembler and debugger are available seperately.

The online help is eminently useful, even though I don't read German very well (about one semester worth of study, many years ago). The reason it is so useful is that it gives you function prototypes and associated information in a "hypertext" style format, where you can click on highlighted cross references in the help window for further information.

People who are interested in an English language version of the package should definitely contact Borland and let their voices be heard. As I've mentioned in previous posts, this is a fine development system. Despite some quirks, it's really fast and generates excellent code. It deserves to be seen in English speaking markets, but that won't happen unless and until Borland perceives a market for it.

I'm afraid this one has me a little lost--in my world, these are analog-digital conv. and digital-analog conv. respectively. I'm not sure what options you think there are...

Hi!!!!
I just heard about atari's new policy..you (the store) pays 50,000 and atari sends you whatever they want!!!???!!!Here in buffalo we went from 4 ST dealers about 2 months ago to 1 this month!!!!!THey say that they refuse to pay 50,000 to get as atari calls it the "Priveledge" to sell atari!!???! What kind of stupid policy is this???? Its getting to the point where atari should pay dealers to sell their equipment!!!Not have dealers pay them!! I dont mean to say I hate Atari...I love my St but I think that the marketing and management people at Atari are the ones that should go to school and learn sales and marketing!!

steve@thelake.mn.org (Steve Yelvington) writes:

| Mark Williams uses a strange method of passing extended arguments that
| encodes redirection in environment variables.

While it is true that the Mark Williams method of encoding redirection
is part of their extended argument scheme, the problem here is not
with the extended argument scheme but rather with their "unusual"
implementation of isatty() and associated funcitons.

The ARGV extended argument specification, a refined version of the MWC
extended argument method, has been documented and is supported by
Atari. Please use it. The correct way to do isatty() is also
documented and supported by Atari. Please use it.

Regarding the Fforce() fix recently mentioned by Dale...
| I'm not going to even try to describe how it works, but since kbad has
| more or less publicly blessed it, perhaps Dale or John will post some
| code.

cough Um, no. I did not publicly bless the Hblank file redirection
hack. I haven't even seen it. All I said is that processes are
guaranteed to start at IPL 0. What you do with that information is
your business - but BE CAREFUL. When you play with fire, or
assumptions about GEMDOS, it's easy to get burned.

>
>Why is the second mnemonic not accepted ? Has anybody an idea how to use
>labelled adresses ?

My 680x0 assembler is a little rusty, but I'll give it a shot anyway...

The pound sign moves immediate data into a register. If you're trying to put the address of init into A0, the command would be 'move.l init, A0'. If you want to move the contents of the location pointed to by init, then you'd do a 'move.l (init), A0'. I think that's right.
So the only reason your line doesn't work is that it (the compiler) is expecting immediate data (a number) where you have a symbol.

If this is the same monitor which was being sold under the Commodore
nameplate as the 1084 for a while, it is junk. Ask any 1084 owner
(like me). Commodore eventually dropped Magnavox as their manufacturer
and went back to whoever made their original Amiga monitors (Phillips, maybe?).

It does make a great video monitor though...

Hello,

Thanks to whoever posted the suggestion to use _exit() rather than exit(). Actually, I wasn't using exit() explicitly, but assumed that it would be called by default when the code runs out and hits the last curly brace in main(). Anyway, putting it in explictly didn't help, and using _exit() made things worse: now I get 6 bombs, or possibly 3 bombs displayed twice, as there is a brief delay between the display of the first triplet and the next triplet of bombs. I even got rid of rsrc_free() by using mrsrc_load() and linking the RSC tree at compile time. Didn't change a thing. I can't figure this out...

From: lorena@infmx.UUCP
Message-ID: <3263@infmx.UUCP>
Source record: 244177

I have a problem with my Atari 520ST and would appreciate any help from anyone who may have had experiance with a similar problem.

The machine is an old model Atari 520ST with a memory modification to take it to 1 meg. The problem happened all of a sudden one night. I had left the CPU running with the monitor turned off. I heard from across the room a faint ticking noise and upon investigation found that it was the drive head clicking.

I turned the monitor on and there where lots of colors on the screen. Thinking that I had a problem with the MMU chip (I have had to reseat it a number of times in the past by dropping it on a hard surface... the recomended treatment for such problems I was told) so I turned the machine off, unplugged all cords and dropped it onto the floor.

When I plugged it in, the machine booted off my hard disk as usual, but I could no access my floppys!

I have two questions:

1) What chip needs replacing.

2) If it is the Western Digital chip, where is a source for replacement.

At this point, any information is appreciated. Thanks in advance.

1073. Page flipping using interrupts.

Newsgroup: comp.sys.atari.st

From: marc@cpsc.UCalgary.CA
Message-ID: <2447@cs-spool.calgary.UUCP>
Source record: 244199

Hi there. This is a problem for all you ST graphics hacks:

Let's say I have two 32K buffers allocated in memory (each
32K buffer contains a bit mapped image to be displayed on
the ST's screen). We'll also assume that there is a pointer
to the start of each buffer ("page").

What I want to do is use the ST's vertical blanking interrrupt
to trigger the execution of a small chunk of code every time
the screen is refreshed (this isn't hard).

The code has to cause the screen's "physical base pointer" (PBP) to
alternate between the starts of each of the two pages. Obviously
I can just assign the value of the first page's pointer to the
PBP on one interrupt, and then assign the second page's pointer to
the PBP the next (and continue in this fashion using this "swapping"
method)...

Here's the problem:

Can I use the OS's allready present "set physbase" call to set the
new PBP? I don't think so, since I'd have to use a TRAP instruction
(in 68000 assembly), and a TRAP also generates an interrupt
(correct me if I'm wrong, but generating an interrupt WITHIN an
interrupt will cause a bomb, right?).

And there's another problem with this method: "set physbase" waits
until each vertical blanking interrupt to set the new value (if
memory serves..). That's the interrupt I'm allready processing.
It could get ugly.

If my "fears" are confirmed, then I'll have to actually find the
address of the PBP in MEMORY and set it THAT way (which is a little
messy for my taste, but I'll do it if I HAVE to)

Thanks in advance,

The Atari ST has a fairly decent color monitor (for its price), and
resembles CGA in its resolution (640x200x16 colors). Is this monitor
electrically compatible with CGA? If any netlanders have tried it I'd
be curious to find out what you need... I have both machines, with
monochrome on the clone and color on the ST, but occasionally would
like color on the clone. Thanks,
fred

Graham, could you post the full price of the Lattice C version 5??

You only posted the upgrade price in this message.

Also, would I get a newer version of WERCS with version 5??

You might remember that I have been using WERCS but an old version which
crashes my HRD files. I would buy Lattice C version 5 if I knew that I
would get a good WERCS with it!!

The ANSI compatibility is another reason why I am interested in it. I wonder
who is distributing Lattice C in the USA now?

Well, thanks alot

MY mom and two sisters live in Urbana Ill and while I was there last Thanksgiving
I looked for an Atari dealer. I could only find one and that was One Stop
Computers. I drove looking for One Stop computers and it appears that they are
in a HOUSE!! Not a store at all but a HOUSE in a residental section of Urbana
near the University of Illinois.

My question is:

Are there any other ST dealers in the USA which operate out of a house?? I mean stores
with retail sales, not just mail order.

It seemed kinda strange to me, but I am spoiled by my local Atari dealer
who has TWO real stores!!!

> (2) The Atari communities theft ratio is higher than
> any other platform. (40-50% based on a two year
> old Compute! article.)

I do not consider it valid to take statistics from a 2-year old article in a popular press computer magazine to enhance your current argument. The statistics would have had to have been compiled sometime back in 1986, which is more like 3 years ago -- at which time the Atari ST was barely up and running in the United States market.

It is, unfortunately, very difficult to assess the reason for poor software sales. The folks at Spectrum Holobyte, for example, were complaining about poor sales (due to theft) BEFORE a single advertisement for their product hit the magazines.

(I actually got a chance to play with the program for about 3 days, and was not impressed. Count one person who didn't go out and, as one anti-pirate suggested "Buy anything that comes out for the ST so developers will write more software.")

My own software purchases totalled about $100 in 1989. Perhaps one of the reasons for lower than expected software sales could be that the publishers aren't providing me with any software that I particularly want, let alone need. Multiply one person by 200,000 and you have a 20 million dollar market, while publishers might be expecting perhaps a 100 million dollar market. It's easy to blame theft for poor sales, while the real problem may be that some products simply don't attract enough attention (or fulfill enough peoples' neds) to merit more sales.

>to a processor exception occuring ? Thanks..
>
> -JtK

The number of bombs on the screen is equal to the number of the
processor exception. These are as follows:
2 bus error
3 address error
4 illegal instruction
5 zero divide
6 CHK instruction
7 TRAPV instruction
8 Privilege violation
9 Trace
10 Line A emulator
11 line F emulator
12 - 14 reserved

This info is a summary of the bombs entry from the MWC manual.

Computer Music is not inherently real time (i.e.MIDI). The
programs I mentioned run in UNIX and allow a composer to specify
networks of virtual synthesis modules (like a Buchla 200) and then
they spit out samples to a file. I would need Digital to analog
converters to hear any sound I generated, and Analog to Digital
converters to use these programs to process externally generated
material (like Ethel Merman). I know there has been a port, as
I talked to someone at ICMC (conference) who used Csound on an
ST, but I've lost his address. (For those interested in software
synthesis, a note: a minute of sound could tie up your computer
for days.)

Sinc,
Clark

Hi,

I'm writing a program that converts MAC Paint Pictures in Gem Image
files and vice versa. As I don't want to reinvent the wheel, I ask
here wheter somebody has written some code (I prefer C) that packs
a monochrome Bitmap into a Gem Image or a Mac Paint file. I also
plan to include the TIFF Format, so if you have a packer for this
please let me know.
As it's much easier to unpack images, I can write the unpacking code
on my own (part of this is already done) but if YOU have written such
a procedure or program I'd be really happy to get the code, because
it saves me much time.
At the momemt I'm writing the Gem-Interface for the program and this is
really a lot of work to do if you have to begin from scratch. I plan to
release the program into the PD in a few weeks.

Thanx a lot .... Bernd Feist

Our band is wanting to get into some Midi now that we have a Yamaha PTX8 Electronic Drumkit, Yamaha TX16W Sampler, and a Kawai keyboard, all Midi..

I priced the stuff I would have to get for my Apple II at about $225 to get on board with it. A friend of mine said he could get me a 1040ST with built in 800K drive, 1 Meg RAM, and Monitor for about $500.

My question is directed to those Midi Mongers out there who play with midi all the time.... Is the Atari the best computer for Midi for the price?! Is the midi software good?! We just want to use the Midi Computer as a sequencer to throw some keys on top of some stuff that we want to do, but are short an extra band member... However, I would like to get something that is flexible enough so that if we decide we want to sequence together like 3 or key tracks and a couple tracks of sampled sounds, etc... if we get the burning urge...

I would like to get open-minded comments...So please give good and bad points about Midi on the Atari-ST. Also, does most of the good Midid software work on both the 1040 and the 520?! If we can get by with spending even less for the 520 and still get the use out of the sequencer that we want, that would be great also...

Thanks in advance for any info!

Later - Dan Vachon - !att!druwa!dvac

>
>-larry

Just FYI,

About 4 years ago, there was an Apple dealer who was selling 20 Meg removable media drives based on special 5.25" floppies. This drive also used optical correction in aligning the heads, but I was doubtful about the reliability of putting 20 Meg on a disk that could come in contact with contamination.

These newer 3.5" floppy-based drives seem lower risk, since the shutter would help keep away much of the debris that can collect on floppies.

Thanks Ken. Much appreciated. For the record, I don't think Atari UK are malicious or even particularly incompetent - just overworked. I believe the company's just a little too 'lean and mean' these days. Too many products - from the Lynx to the Transputer workstation - and too few people to support them.

Graham

ps. UK mags have been saying that disks formatted with the STE and TOS 1.6 are not readable by IBM PCs. Any comments?

#
#I requested a catalog (via FAX) over a month ago, and so far
#have had no response. I suspect that they are out of business.

As of last week, they are still there and still VERY busy. Some of the problems might be due to that busy-ness: the only problem I have ever had with them is slowness due to to many other things going on and my individual problems necessarily being low priority to them. I got my catalog last week when I dropped my hard drive off for service.

>Why is the second mnemonic not accepted ? Has anybody an idea how to use
>labelled adresses ?
```

The second move.l ought to work (that is, it's correct assembler syntax).
You could try:

```
movea.l #init,A0 ; if the assembler's fussy
```

or

```
lea init(PC),A0
```

or

```
lea init,A0
```

as two alternatives.

In case you're not familiar, lea loads the EFFECTIVE ADDRESS of the operand into the address register. So, whereas `movea.l init,A0' would put the CONTENTS of `in' into A0, `lea init,A0' put the address of `init' into A0.

On a simple level, `movea.l #N,An' and `lea N,An' are equvalent.

On the other hand, you simply may not be able to use `init' in that context. It may be a compiler restriction. I haven't used it so I'm guessing. Try lea and that might work.

Dave.

1090. FORMDIAL.PRG

Newsgroup: comp.sys.atari.st
Date: 1990-01-30 22:50:53 UTC
From: ncastellano@eagle.wesleyan.edu
Message-ID: <6157@eagle.wesleyan.edu>
Source record: 244179

What does the program FORMDIAL from the archives do? The index says it speeds up dialog boxes, but I got it and unarchived it, and it contains no documentation, and doesn't seem to affect system performance, and doesn't display any messages or anything, just exits. Programs like that make me nervous.

Any info on this would be welcome...if you don't have any experience with it but know 68000 assembler pretty well, it's only about 500 bytes so it shouldn't be too hard to disassemble. I looked at it myself but I don't know 68000 assembler well enough to make anything of it.

Thanks...
Nick

I have a Mac emulator and was wondering if anyone had a program or init to read the system defaults from disk? I really hate to go to control panel and select mouse and then click on fast, just to get the mouse to move at a reasonable speed. A friend said he thought such a thing existed but I have never seen it. If someone could send me either the program or the name and a anonymous ftp that has it I would appreciate it. Thanks.

~
>Horace Mitchell, the author of the piece, did an outstanding job of
>putting all of this together and providing extra documentation.
~

I'd like to confirm this message. I called CN and requested the discs.
Received them in about 5 days.

The instructions on the disc are very clear and spell out exactly how
to set the system up. The files on these discs seem to be the same
ones I was having trouble with just a couple of weeks ago. The author
HAS done an outstanding job with the additional documentation.

Thanks to John Barnes for the pointer and to Horace Mitchell for putting
the package together.

> the ST community.

How can you say this? I think ST owners buy a larger share of
software than users of ANY other computer. I know quite a number of
ST owners, and EVERY ONE OF THEM has bought a lot of software,
myself included!

On the other hand, the biggest pirates I've seen are people with
IBMs, Macs, and to a lesser extent, Amigas. And not just in this
area either (Rochester, NY). I live in Connecticut (when I'm not
taking classes at RIT), and the situation there is the same. I
refuse to believe that ST owners pirate worse than their IBM/Mac/Amiga
counterparts.

You know, Rob, the people a year ago who started the last flame-war on
this topic thought it belonged here. I don't see why you want to do it
all over again.

If you still insist on doing it, you can avoid doing this:

> (2) The Atari communities theft ratio is higher than
> any other platform. (40-50% based on a two year
> old Compute! article.)

Proof? This is proof? A two year old article, which had some sort of survey
which didn't encompass a statistically significant portion of Atari ST
owners, much less any other platform?

Please, don't waste our time and money.

No, but Flight Simulator II does. Not as nice as color, and pretty non-violent, but a very nice simulation all the same. Falcon (and Populus) easily provide rational for the purchase of a color monitor (IMHO).

I have seen this printer work with Wordup (LQ800 driver installed). Worked fine, and looks great. I assume that the LQ2500 is downwardly compatible with the LQ800. Incidentally, the printer was purchased for about $270 from an outfit in New York (if memory serves). I found this unbelievable, given the quality of the printer. I could dig up the address from the purchaser if y'all want it.

1101. Tick-tick-tick-CRASH! is not dead in TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-01-31 03:56:53 UTC
From: bane@mimsy.umd.edu
Message-ID: <22199@mimsy.umd.edu>
Source record: 244181

The dreaded keyboard-repeat-and-lock crash bug is apparently not gone in TOS 1.4. For those of you who haven't seen it before, what happens is after several minutes of fairly steady typing in an editor (I use Word Writer), the keyboard suddenly starts slowly retyping the last seven or so keys you typed, over and over again. After about 10 repeats, your program crashes.

This hadn't happened to me for over a year until tonight; I had hoped that it was some bad desk accessory that I had abandoned. WRONG. This time, I have some information that may be useful to some real ST wizards, as I was running under Neodesk and landed in its error handler. The strange thing is that I landed there twice; once from Word Writer, and again after exiting the handler when it tried to reload Neodesk. The second time locked the keyboard for good, necessitating a reboot.

I would like to try and narrow down the conditions under which this happens. If you've had it happen to you, please send me mail describing your system set-up and what you tend to be doing when it hangs on you. Eventually I'll summarize it to the net. A descrption of my system and the dump follow.

520 ST, upgraded to 2.5 Meg with Tech-Specialites board
BMS-100/Adaptek 4000/Quantum 80 Meg hard disk
Mono Monitor
DAs:
Neo Control Panel and Printer Queue (corner clock on)

1102. pc-ditto II

Newsgroup: comp.sys.atari.st
Date: 1990-01-31 05:31:28 UTC
From: pietrzak@mango.CES.CWRU.Edu
Message-ID: <1990Jan31.053128.1498@usenet.ins.cwru.edu>
Source record: 244185

I just received my pc-ditto II through the mail today! The board measures about 4 3/4 by 7 1/4 inches, and contains an NEC V30 chip and a socket for an 8087-1 coprocessor. It connects to the ST by piggybacking on the 68000 with a solderless clip-on attachment (great for hardware klutzes like me). Unfortunately, when I opened up my mega, I discovered a small "patch chip" grafted to the top of my 68000. In the installation manual (which, by the way, is relatively helpful and thorough in describing the procedure to put the board in place) does mention this problem, and offers two solutions to the problem; namely moving the patch out of the way with the help of a few wires (by your dealer), or purchasing an Expansion Bus Connector to bypass the problem completely (probably what I will do).

The other problem I have had is that the pc-ditto II user manual was not included in my package (although it was mentioned in the installation manual), so I don't really know the final specs for this board. Hopefully, I'll be able to get this and the bus connector from them in the near future.

Just wanted to pass along the good word . . .

>Several articles lately have said things like
> "I was unable to get ICONE2 to work."

>Have you? Has anybody? What sort of setup were you running on?
>Is your ICONE software the same as what has been posted?

I posted this already once a few days ago, but I am not sure if ever
went out to the world. So here it is again.

Yes, I have been using ICONE2 for a long time (ca. 1.5 years or more). It's
a little program that replaces the desktop icons (the ones for files and
folders) by much nicer ones. You can set wildcards for the various icons
and you can even create your own ones. It's really neat and I love it.
However, if you have one of those alternate desktops, you won't need it
since those desktops have icons on their own.

As far as I know the accessory is written in a non portable way. It
assumes TOS 1.2 (Blitter-TOS), and patches the TOS directly (I don't
know this for sure, it's just a rumour). Because of this I don't expect
it to run under TOS 1.4 :-((No, I don't have TOS 1.4 yet :-(()

1107. Fancy Screen Savers

Newsgroup: comp.sys.atari.st
Date: 1990-01-31 07:41:39 UTC
From: bluneski@pogo.WV.TEK.COM
Message-ID: <8471@pogo.WV.TEK.COM>
Source record: 244168

On the subject of fancy screen savers...

There is a very nice one on Genie called STARSTRK.ARC (file #13445) that displays random starbust pattern. Stars are in color on a color monitor It's very nice on a mono monitor because you don't just get the black/white reversal but a real screen saver. The downsides: 1) it's a ACC rather than a autofolder item(i.e. it takes one of the six precious spots) 2) the idle timeout length is hardwired to 3 minutes. All in all it's the best(and certainly the most entertaining) screen saver around.

>Anybody received the new version of Wordup? What new features does it have?
>What bugs were fixed? Postscript output? Inquiring minds want to know!!
>

I purchased WordUp 2.0 from E. Arthur Brown about three weeks ago. not having the old version of WordUp, I am not ssure which features are new.

No, there is no direct Postscript output. The manual states that WU can be used with UltraScript ST and the SMM804. It also advertises NeoCept's TurboJet, an HP LaserJet driver for GDOS.

Printers supported include your basic EPSON MX and compatibles, the LQ (24-pin) series and compatibles, Citizen 224, Gemini, SMM804 (native non-postscript emulation) and the aforementioned Turbojet.

There are three typefaces included: Swiss/Helvetica, Dutch/Times and Typewriter/Courier. If you purchase Fontz!, also by NeoCept, you can convert Mac/Amiga/Degas/Hippo fonts to GDOS for use in WU or other GDOS using programs.

In addition to Degas, NeoChrome and .ImG files, .GEM files are now supported.

Suggestion - serious use of this program requires a hard drive and >= 1 megabyte of memory. You can have only a few type sizes loaded with a 512K machine, and I was able to load only one graphic image into a doc at a time.

In the latest issue of STart that I saw at Waldenbooks last weekend, NeoCept had a sinister white-on-black full-page ad describing the additional features of WordUp 3.0, including a speller/thesaurus and free upgrade for purchasers of WU 2.0 (after 12/31/89)

Standard disclaimers apply; i speak for myself.

REF. Discovery Cartridge
To. Matthew G. Hetman (Sorry I send this mail to your address at ucbvax.Berkel
ey.EDU but It bounced)
Glad to know another Discovery Cart owner. I bought the Option 2 last yea. It
came with Version 2.7 Utility Disk. When I saw Happy Computers Advertisement
mention that ther new version can read Mac disk file by file and if used with
Spectre 128 it can run Mac disk without conversion. I send Registration card in
for upgrading since June 1989. I never receive any reply from them. Would you
be so kind to enlighten me on few details below:
1. What is the latest version of Discovery Util software? How do you get your
upgraded?
2. How to modify the cartridge to accept Spectre 128 cartridge? I beleive that
the detail should be included with the new version software.
(I own both Spectre 128 and GCR but still curious to know how to make use
of my 128 with Discovery Cart.)
3. Is the Happy Computers still exist? I can't find their advertisement in the
recent magazine. Many thanks in advance. Suthipuntha AKISUJAR@NUSVM

In <34325@iuvax.cs.indiana.edu> stowe@silver.ucs.indiana.edu (stowe) writes:

-> Caveat emptor. Let the buyer beware. If you are in an area where
-> there is no dealer, learn to read... magazines, the network,
-> information services, bulletin boards... there is no dearth of
-> information available to the user who is truly interested in
-> finding it. In the Age of Information, there is no excuse for
-> buying blind except perhaps laziness... and stupidity.

Personally, I don't own an ST.... I think there's still one store
around here that sells 'em though, and everytime I've ever been in
there, the ST hasn't even been patched into a monitor (the C64 usually
seems to get the spotlight).

At any rate, I would hardly call the various software-review magazines
a plethora of information. To trust a reviewer completely is utter
stupidity; to trust two similar opinions might be all right, but it
still doesn't mean anything you buy will be your cup of tea. So,
without a demo, there are really two options: (1) don't bother buying
the software or (2) pirate it and if you really think it's worth the
$50, $100, etc, buy it then. At least, unless you're willing to just
toss $100 in the toilet every now and then when you buy a MagicSac
disguised as a Spectre.

From: mjk@ztivax.UUCP
Message-ID: <892@ztivax.UUCP>
Source record: 244057

Hi,

does anybody know about terminal programs for the Atari ST handling Kermit protocols? A program that does both terminal emulations, and the normal Kermit functions like send and receive would be even more appreciated. Right now I'm working with a very primitive Kermit for the ST. It's not a GEM program but a .TTP, so there's no switching between the emulation and the send/receive, the program has to be started for every single function. One particular problem is the handling of cursor key events. The host machines (Sun 3, Vax, Apollo) provide perfect termcap entries, but obviously my dumb Kermit gets its input by simple getchar()'s, i.e. it throws away the high byte of the keyboard event. So, when I press a cursor key, all I see on the screen is a Ctrl @ (the NULL character). Maybe I can get something that's a little more comfortable.

If someone can help me, please e-mail to me. Help is appreciated in any form (binary, source, or pointer).

Thank you,
chr

Let's compare apples to apples here...it makes sense to want 3 seperarte
items that perform their tasks perfectly than 1 item that performs 3 seperate
tasks half-ass.

Look at the list of software that wouldn't run on the Megas! You bought a
piece of software for an ancient IBM PC, it worked on a PS/2. period.

As for wives, the one you described is taken. :-)

>their fee. I don't think that they can *expect* people to pay. As for
>me, if the product is worth the money, it doesn't matter how it is
>distributed.

The problem for shareware authors is how to manage to really
get some money for their work. Even if he puts a note like "If
you use this program regularly please send some money" into his
program the overwhelming majority will not pay. The reason is
simple: They want to keep their money with themselves. I - as a
shareware author - can understand this reason.

If the shareware author does really want to see any money he
has to find out how he can "encourage" the user to pay. This
can be done be offering some additional benefit for paying. I
tried this with my Arcgsh from version 2.1 upwards: From time
to time a dialog box pops up and asks the user to pay for the
program. He then can click any button and the program
continues. This procedure has two advantages:

1. Occasional use of Arcgsh: The user can take full advantage
of the program without paying. The "Please pay your
shareware donation" dialog boxes he can ignore. He is not
forced to pay. The boxes will not disturbe him too much
because he uses Arcgsh seldom.

2. Regular use of Arcgsh: The frequent popping up of those
dialog boxes gets really annoying and the user wants to get
rid of them. And this is exactly what he gets if he pays his
shareware donation.

Experience has shown that this procedure works very well.
Before I implemented it in Arcgsh V2.1 I released Arcgsh V1.0
and V1.4 and got exactly *one* shareware contribution. After
release of Arcgsh V2.1 (which offers support of the Zoo
archiver) I received *several* donations. No, I am still no
millionaire :-(but I am encouraged to proceed working on
Arcgsh.

>If not, I congratulate him for learning the beauty of portability :)

The sources for the ST are not neccessary as long as the binary
itself works without problems. What is needed are Arc 6.02
sources for UNIX so that Arc 6.02 can run there, too. Subdirs
etc. in an archive do not help much if I cannot deal with them
on my UNIX machines.

> Ciao, Hasko

well, once again Atari Corp has shown how much it cares about the
USA market by releasing its new products overseas first. I really wonder
just how committed Atari corp is to the USa market anyway??

So, I am happy that the STe isn't Vaporware but it just joins the group of
other Atari products that have never been sold here in the USA. Like th
entire line of PC clones, the TT, and now the STe. Geez, when will Atari ever learn
that the USA is not some hick third world country?

1124. Want pseudo-trap handler examples

Newsgroup: comp.sys.atari.st
Date: 1990-01-31 15:34:41 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Jan31.153441.7404@chinet.chi.il.us>
Source record: 244011

I could really use examples of handlers for the software trap vectors. Let's just say that the documentation I have available isn't entirely clear or consistent. Specifically, if anyone would care to post fragments in C or assembler that did the following 2 functions, I probably wouldn't be the only person grateful to see them:

1) Attempts to read from a floppy disk. If there is no disk in the drive, writes a message to the screen and waits for a keypress, then retries the original read (etc until satisfied). The built-in 'drive not responding' alert is never activated.
2) Accepts input into a string with Cconrs (do I have the name right? I never remember such things, and my manuals are elsewhere). If control C is pressed it intercepts the terminate vector and does something sensible (like clearing the input string and starting over).

Thanks.
Steve J.

1125. Re: Tick-tick-tick-CRASH! is not dead in TOS 1.4

From article <22199@mimsy.umd.edu>, by bane@mimsy.umd.edu (John R. Bane):
> The dreaded keyboard-repeat-and-lock crash bug is apparently not gone in TOS
> 1.4. For those of you who haven't seen it before, what happens is after
> several minutes of fairly steady typing in an editor (I use Word Writer),
> the keyboard suddenly starts slowly retyping the last seven or so keys you
> typed, over and over again. After about 10 repeats, your program crashes.
>
This is similar to various bugs which many people have encountered with
First Word Plus. (No coincidence, probably. I understand that both
Word Writer and First Word Plus were written by the same outfit - GST in
the UK.)

We used to get the 'repeat then crash' a lot with Wordplus v2. With UK
version v3.14 we now mostly get a simple freeze - the program just seems
to stop accepting keyboard & mouse input, and the only way out is to
reboot. GST say it's something inside TOS (or GEMDOS or whatever layer
it might be), so I was rather hoping the problem might go away with TOS
1.4.

Does anyone have any information on what the problem might be? It's
frustrating, because there doesn't seem to be any way of replicating the
problem. People can go for months without it striking, and then have it
happen twice in a day. (Sunspots??? :-))

For what it's worth, it hasn't happened to me so often since I installed
Turbo ST (the software blitter, not the acceleration board Turbo 16),
but it has happened a couple of times. It has happened to a wide range
of people where I work, from techies to novices, from hunt 'n peckers to
touch typists.

Does anyone know of other programs where similar things happen? I
recall some messages a while ago about WordPerfect hanging, but ours has
been OK.

I'm waiting for the bug to strike while I'm running Wordplus from within
NeoDesk, so I can try sending a few wind_update() calls. Would this do
any good?

Thanks,

Graham

>official release in comp.binaries.atari.st.

Ok, I decided to release the intermediate version (Arcgsh
V2.1c) and just sent it off to Steven Grimm. It should really
soon now appear in comp.binaries.atari.st. Those of you who do
not receive that newsgroup will (hopefully) be able to get it
from the panarthea archive server.

Possibly. Maybe they are just trying to weed some of the marginal dealers out
and came up with a mediocre way of doing it. There has been net traffick on
atari dealers that should be avoided. But I agree Atari doesn't have the clout
for this.
A SUGGESTION: For those interested in commenting on what Atari's marketing
policy and distribution policy should be, send them here and I will
summarize.

Sinc,
Clark

I've got an UltraDisk from Alpha Systems, which has 4 meg of memory installed. When I phoned them Monday, tho, they said they were no longer making any of their cartridge port RAM disks any more. Obviously it's a doable thing, mine is really pretty slick. They said it was too hard to obtain certain special parts their design required, which is why they stopped making them.

Anyway, I want to mention this just as a suggestion - if you come up with your own device, it would be nice if it could accept up to 4 MB (or more, if you're really memory hungry, like me. }-) and also have its own power supply (like this UltraDisk has.) The UltraDisk can draw power from the ST thru the cartridge port, but also has a jack for an AC adapter. It will retain it's memory even if the ST is turned off. As long as the jack is plugged in, the memory stays intact, even if unplugged from one ST (and, say, inserted into another, for a quick "file transfer" of 4 Megabytes as fast as you can plug in a cartridge! }-) Your board should be just as capable.

Also, a suggestion which you're free to disregard. I haven't seen the technical info on the UltraDisk, so I don't know how they do things, but this should be possible. The primary use of this thing, as I see it, is as a RAM *disk*. Disks are generally used as *block* devices. Instead of requiring 3 reads per *byte* of data written, how about this - all writes are always done in *blocks*. Say, 32 or 64K per block. When you want to read a particular block, you "write" its

block number to your input addresses, and the entire 64K gets bank-switched into your cartridge port address space. When you want to write a block, you only "write" one address. Then you write all the bytes in the block in a loop.

Maybe 64 or 32K is too large a unit for general use. After all, disk sectors are only 512 bytes each. How about -
first & second read specifies a 512 byte block #
third specifies a count of blocks to write.
Since you're acting as a RAMdisk, you're guaranteed that you'll always be doing I/O in chunks of at least 512 bytes. Using the count mechanism allows you to perform the equivalent of track write operations, for example.

Maybe it's too much trouble, I don't know, I haven't tried to work out the details myself. I know that my UltraDisk is slower for I/O than my Quantum hard drive, though, and I think it's because of the contortions you have to go thru to read and write byte by byte. If you could speed it up, it'd be awesome stuff.

I found that FORMDIAL did indeed increase the speed that dialog boxes were
drawn at. (A performance benchmark program told me this.) I also
discovered that it affected the execution of some games (namely Empire)
hence I quit using it. (The speedup wasn't too dramatic anyway - you
won't notice it unless you actually run a benchmark of some sort.)

>bombs. Other programs can be launched from the shell before exiting it
>without error, the shell only crashes upon attempting to exit to the desktop.

Do you malloc() memory and change screens via Setscreen()? If you do,
you must be careful to save the original values of Logbase() and
Physbase(), and return to using them via another Setscreen() before
you exit. Otherwise, when your program exits, the memory you
malloc()'ed for your screen is freed, allowing it to be allocated by
other processes. If the desktop writes on the screen at the addresses
you left active, it can scribble all over the free-memory pool,
resulting in spectacular crashes.

As a general rule, one of the first things I create in each GEM
program is an initialization routine and a termination routine. These
share certain globals, such as the original values of Logbase() and
Physbase(), the initial palette, and so forth. Then I religiously
call my termination routine anywhere the program exits (such as within
fatal error handlers). This assures that things are put back the way
they were previously.

(Four bombs is an "illegal instruction" error. This suggests that
code in RAM is getting clobbered somehow. In my experience this
usually results from wild pointer references (storing through a
dereferenced, uninitialized pointer). Any code that does a malloc()
or close relative is suspect in that case.)

>Atari over becoming a 'business dealer' because they were in a house
>as opposed to a flashy storefront (don't quote me on that one (at least
>not by name!)).

The "sort of" is right. The area is what was originally "Castleton" and was absorbed by UniGov back about 20 years ago to become officially Indianapolis (since we are within the county limits). Most of Castleton has been taken up by the mall (the largest in the state) and buhzillions of little strip malls, however, the Bash Street area (north and south of 82nd Street) consists of old houses that are occupied by one or more businesses now, mostly artsy-craftsy type businesses (antiques, crafts, etc.) with a vet, a couple accountants, a glass store and a computer store (;-) thrown in for good measure... but no, no one lives in the house... it just feels like it most days. ;-) As for the business center, that was true... Atari (well, one person at Atari, as we got it... one very important person, unfortunately) felt that we needed a ComputerLand image. Fortunately, the local user groups, the other local dealer (honest!) and numerous customers wrote lots of letters to lots of people at Atari and explained that, at least in this part of the country, people want a place where they can be comfortable asking questions, and ComputerLand was not a place they would go... in addition, several of these customers were already business customers and explained how we had really helped them out. One, unfortunately, had to write (and fairly angrily, may I add) that because of Atari's closed-minded policies (I think those were even his words), he was writing on one of the new departmental Macs rather than on the Mega system that he had hoped to be able to get from us. (That was his second letter... his first, to only one person, had received no response at all, which made him even less happy.)

On another point for good fortune, that particular letter to the Tramiels, Sig Hartmann, Bill Crouch, Augie Liguori and a few others, prompted a phone call to our customer from Bob Brodie... and eventually led to Bill Crouch's decision to let us carry the business line of equipment. (Even funnier is that the majority of our business customers are running off STs, while the majority of our home users are going with Megas *grin*... Most of the home users looking at 520s/1040s are parents...)

But no... the store isn't flashy. We'd rather spend the money on keeping nifty stuff in stock.

No one needs to quote you, Jeff... (*grin*) Just remember... I know where to find you...

>A good store with good support, software- and hardware-wise.

Thanks for the compliment!

(Honest, folks! I didn't bribe him!! It was totally unsolicited! I don't even think he knew I was here! Honest! :-)

grahamt@syma.sussex.ac.uk (Graham Thomas) writes:

| ps. UK mags have been saying that disks formatted with the STE and TOS
| 1.6 are not readable by IBM PCs. Any comments?

Sounds suspiciously like a case of bad floppy or old DOS. The desktop formatting code did not change AT ALL between Rainbow and STE TOS.

Compatibility problems can arise with old MS-DOS versions which use a magical "media descriptor byte" rather than the proper parameter block information from the boot sector of a floppy. The "media descriptor byte" is not supported by GEMDOS, nor is it supported by Microsoft any more. Incompatibilities also exist among certain PC drives - not only with ST formatted disks, but with PC formatted disks as well.

Am I being paranoid, or has there really been a proclivity on the part of the press (UK and elsewhere) to slam the STE??? I've heard more negative rumours and outright lies about the STE than any other recent Atari development. I wonder why this is?

Not sure about the Csound stuff...but in terms of hardware Hybrid Arts makes direct to disc recording stuff for the ST/Mega that you could perhaps get documentation on to use for soundfiles. Also DigiDesign has announced 'SoundTools" for the ST/Mega which could be used. Also there is a 45 Meg removable disk drive (based on Syquest (?) drives) available for the Atari that would be good for sound files...should allow for about 4 minutes of CD quality audio.

>"I say you *are* the Messiah, Lord! And I ought to know, I've followed a few!"

Compute! is a very unreliable source, quite frankly. Matter of fact, there is no reliable way of giving a percentage of users who are pirates, for any machine (except maybe one that sells less than 100). In the "recent" fiasco about Spectrum Holobyte, the figures whoever it was who wrote the article (president of SH or some high position) put in figures and misinterpreted them. In that article, the percentage of ST pirates was less than any other computer (IBM, Apple).

It is my personal opinion, from my personal experiences and contacts, that the percentage of ST pirates is far less than IBM and Apple (everybody I know who has either of those brands of computers pirates; I know quite a few ST owners who are honest... and quite a few who aren't).

And that doesn't mean diddly squat.

The only relevant fact is there is too much piracy in the ST community.

>disguised as a Spectre.

As far as I'm concerned (and, hopefully, most of the people around here)
pirating is *NEVER* an option. Piracy is theft. Period.

I would never trust a single review, or for that matter, even two similar
reviews, however, a combination of factors will give the user an all-around
picture of the software. Even still, life does not guarantee anything.
No matter how long you demo a package, you may well still get it home and
find it's not your cup of tea.

The main point is trusting the dealer from whom you buy your software,
even if they're not "local". We have customers from all over the U.S.,
not just our local area. As I stated in a portion of my posting that
was not quoted, returns are often a case-by-case basis. If someone buys
a package from us and returns it, say, a week later with some legitimate
comments, criticisms, etc., about the package, there's no problem. (For
example, we had a customer buy Weird Dreams... a few days later they came
back with it and some legitimate comments about why they did not enjoy
the game. We issued a store credit which they saved and used against
some service they had done on the machine later.) Now, if the customer
tries to return something every single time (or an extrodinary percentage
of the time), yes, then we're going to think twice about accepting the
return.

To give you an idea of how often this happens, though... in the two years
we've been open (and heaven-only-knows-how-many sales), I can think of
only 3 times off-hand when something has been returned because the customer

wasn't satisfied. 1) Weird Dreams (as stated), 2) A book that turned out to be too elementary for the user's needs, and 3) Migraph's Hand Scanner (because the user couldn't find a way to import the resulting IMGs into Art & Film Director without dithering his pen & ink drawings). Now, there could possibly be a few more, but certainly nothing extrodinary.

Choosing the right dealer honestly can make all the difference... there are some really good people out there. Just as there's no need to buy blindly, there's also no need to throw money away.

>a house. It is impossible to find unless you know the neighborhood.
>They have Spectre GCR and MAC ROMS by the way. They also have a BIG
>dog, so leave your cat in the car.

Hi Richard!

You've probably already read my posting about the "house" that isn't a home.

Actually, we're not at all tough to find... you just got directions from
the wrong person. :-)

Yes, there is a large dog there sometimes, but she has no malice towards
felines... curiousity, perhaps, but no malice. She has one huge benefit,
though... she keeps the attention of the children that parents bring in
but don't watch! :-) (Well, the dinosaur collection helps, too.)

Can someone tell me why it is that parents let their children get away
things at a store they would *never* let them get away with at home?

(Heck, no... we don't mind if Johnny/Johnette rips open 15 boxes
of software, pounds on the keyboard, yanks the machine off the desk
with the joystick or pulls the phone out of our hands while we're
trying to talk with another customer so s/he can say "hello"...)

Please... those of you who are parents and take your kids to your local
computer store... do your dealer a favor and don't expect the salesfolks
to babysit. Thank you thank you thank you!

>certainly the most entertaining) screen saver around.

This is a neat one, I must admit, although there are some things that
object to STARSTRK's presence, so if you have problems running something,
try removing it from your DAs.

It especially is neat in a dark room... I happened to turn off the lights
but not the system when I went to dinner one evening.

Btw, the black/white reversal is probably safer than an all-black screen saver.

1146. Re: GDOS, Write, 24 pin printers

Newsgroup: comp.sys.atari.st
Date: 1990-01-31 22:11:02 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440099@hplsla.HP.COM>
Source record: 244086

```
|Without dragging my system to a computer store, I have pretty much
|decided on either an Epson LQ-510 or a Panasonic KX-P1124 24 pin
|printer.
|
|My question is if the LQ-800 printer driver that is included with
|Microsoft Write works with either of the two machines. I use GDOS,
|and would like to use the fonts that are used in Write.
|
|Are there specific drivers for either LQ-510 or 1124 out there,
|that are compatible with GDOS?
|
|The Epson, of course, uses Epson codes, but is the LQ-800 driver
|compatible? The Panasonic has LQ-2500 emulation, is it compatible?
|
|I prefer the features of the Panasonic, but if the Epson works
|better with the WP and system I have, then Epson it is.
|----------

I have the KXP-1124 and have used two sets of 24-pin GDOS printer drivers
and fonts with it. They both work very well. One set of fonts is from
Migraph; these are LQ-800 fonts. The second set came with LDW Power v1.1,
and they are for the Star NB15. These are verifiably different fonts (using
cmp) but I can see no difference in the results.

Migraph told me that the LQ-800 fonts do not make use of the full 360 dpi
resolution of the KXP-1124; they are 180 dpi fonts. Just the same, the GDOS
print outs are excellent. Migraph has 360 dpi fonts for the NEC P6 which I've
heard are compatible with LQ2500 and KXP-1124. So far, I've not had any
compelling reason to purchase them, I'm quite happy with the results I get
right now. (I wouldn't mind a better selection of fonts, though. Sans Serif
and Dutch get a little stale).

Message-ID: <8473@pogo.WV.TEK.COM>
Source record: 244088

in <11830072@hpldola.HP.COM> you write:

>Let's say my application is loaded, wakes up and says, "I wonder how much
>memory I can use". It goes out and does a Malloc(-1L) to find out how
>much available memory the OS has. Then it says, "I want all but 50K".

Malloc(-1L) does not return the amount of free memory available to the system
only the size of the largest contiguous block. If your memory is fragmented it
will return less than the true available memory.

>1) malloc() (or Malloc()) all but 50K of the available memory and manage
> that chunk of memory itself. I just can't believe this is necessary,
> shouldn't malloc() be able to do this (see #3 below)?

see #3

>2) Malloc(50K) before any call to malloc() then Mfree() that 50K right
> after the call the malloc() to keep 50K always free for the OS.
> Yuck!, but could be workable on a single tasking OS.

Ugly hack that fragments allocated block structures!

>3) set some switches so that malloc will never take the last 50K of
> memory from the OS. This seems preferable, but I don't know what
> the switches are for MWC (or any other compiler for that matter).

Not available with stock malloc fuctions. Malloc is a VERY unreliable
memory manager and it is best to use the OS call as infrequently as
possible. The most elegant way to do it is to write your own malloc that
limit the total number of Malloc blocks to LESS than 16 and dynamically manage
those blocks as required. Find the source to some public domain C comiler if
you need a prototype for these types of routines.

#Times how many machines?

Maple comes with a 403 page reference manual and a 115 page tutorial.
I'd be hard-pressed to copy this quickly. It also comes with support,
which no pirate can copy. Maple is good software, and costs good money
for a reason. It also has a little built-in anti-pirate protection
because of the good manuals.

Can we stop beating this dead horse already? It was boring a year ago
when we had an inconclusive discussion about it.

>
>Experience has shown that this procedure works very well.

this is actually a very common technique among shareware authors.
before quickst went commercial, the last couple of demo shareware versions
that loaded from the auto folder would purposely put all kinds of
ordering information and "propaganda" on the screen and forcibly made the
user press a key before continuing. this way, people who didn't want to
upgrade to the shareware version (with no such messages or keypress waits)
could still use the program, but they would have to endure the "press any
key" condition EVERY time they would reboot. we got lots of shareware
contributions after that, with almost all letters asking (hoping!) that
the registered owner version not have such things. and of course, that
is the incentive of registering: you get a clean, properly working version
with enhancements and further bug fixes from when the shareware version came
out and the entitlement to receive future updates whenever they become
available.

of course, there are people who will actually take the time and disassemble
shareware programs and remove the offending code which pops up the
dialog boxes, or forces a keystroke before continuing, etc. for the
three hours they spent disassembling and debugging, even someone working
at mcdonalds at $5 an hour could have broken even (at least for quick st)
by sending in their contribution ... but that's their choice!!! :-) :-) :-)

>As I own MT C-Shell and found no differences between the recently
>posted RTX and the one I already had, I wonder why you write
>"This shareware version"...

The shareware version is the exact same binary. The difference is that
registered owners of the MICRO RTX developers kit receive technical
support, while those with the shareware version (i.e. they're not
registered) are on their own.

>Anyway, what I want to know is how the shareware regristration
>affects users of the MT C-Shell (or vice versa). That is (e.g.)
>Do I have to register if I already owned it before (though I didn't
>register my copy of MT C-Shell) ?

The shareware version of MICRO RTX has absolutely nothing to do
with MT C-Shell and has no effect whatsoever on it. MT C-Shell
and MICRO RTX are entirely different things. The MT C-Shell
system uses the MICRO RTX kernel, but the two products are
completely different. MICRO RTX is the libraries and docs
for programmers that want to try and write something like
MT C-Shell or whatever application they want to write. MT
C-Shell is an end-user application that presents a Unix-like
environment.

>

I couldn't reply because mail to you just keeps bouncing.

MT C-Shell is an operating system for the Atari ST that presents
a multitasking/multiuser Unix-like envrinment from which you can
run both MT C-Shell specific programs and standard TOS/GEM programs.

MT C-Shell is NOT shareware. It is a commercial product. It
sells for $129.95 retail. If you can't locate it locally, you
can order direct by calling (415) 530-9637, or send mail to
the address in the sig. below.

MICRO RTX has recently been released as shareware. This is the
low-level kernel upon which MT C-Shell is built. It could be
the basis of other multitasking systems, which you write yourself
in C or assembly or the language of your choice. MICRO RTX
includes all the documentation describing how to use it in your
programs.

Good ol Uniterm 2.0e will do this and more. A very robust and powerful
program. Also, for about $15, one can buy Flash. It does NOT include
Kermit protocol, but there is a desktop accessory that gives it that
capability (which is either shareware or pd, I am not sure). I use
flash myself (without Kermit) because it is much easier to understand
for a novice (which I recently was). Also, it looks better on a color
monitor (IMHO). With a mono, Uniterm is stunning, allowing super teeny
tiny text as an option (really nice with big listings). Uniterm is free,
and probably the most capable and error free terminal program for the ST.

1161. Getting rid of blinking cursor?

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 06:38:48 UTC
From: jpexg@wheaties.ai.mit.edu
Message-ID: <6231@rice-chex.ai.mit.edu>
Source record: 244030

I've written a program in Laser C which invokes an editor via Pexec() and
after the user exits does some other stuff before ending. The blinking
block cursor stays on throughout the program's run and then follows all
the way onto the desktop. It sits there flashing on a window or the background
until the next program is run. It's apparently harmless, but annoying.

Is there a command that gets rid of this troublesome object?

Coderam, included on the Codehead Utility disk, is the best ramdisk program I have used (of many). It is reset-proof (really), and supports many different sized partitions (from a menu at bootup, will go to a user-default in about 5 seconds). This program, along with the others on the disk, are well worth the price. These guys churn out some of the freshest and most useful code for the ST's.

> "Whatever I said, I didn't mean it...unless, of course, you liked it!"
> #include <std.disclaimer>

Ah, such a simple answer for such a complex question. I would say that it
makes sense to emulate a mac on an ST, because it does an equal or BETTER
job of it than the mac itself about 99% of the time, for much less money.
If you want to do work with a PC, buy one and set it up next to your ST.
The biggest flaw with the PC emulators out now is that they don't really
out-perform the real PC's, and are only of use (but valid use) to:

a: people who only need PC compatability occasionally.
b: people who have very small desks, and no money for furniture
(but plenty for hardware add-ons).
c: hacker-types that just want to do it for the fun of having
two or three machines in one casing.

As always, these statements are all IMHO, and I intend to get a PC emulator
board because I fit in group c.

Correct. That's *why* there are newer TOS releases. It's a pain for
developers to keep their software running on TOS 1.0! UPGRADE!

> Does anybody know what is the bug in the old ROMs ? Is it reasonably possible
> o implement these functions by soft ? Where could I get the listings (in C, ev
> in ASM) ?

As far as I remember, the 'event keys' returned by TOS 1.0 are
wrong. Basically, the functions work.

Hi I am having trouble with some PD/sharware programs and my mouse.

TUZZLE 1988 Armin Daubmann
SQUIXX 1986 Michael Kolb
DOMINO_2 1987 Mulsoft

All of these will start and run but seem unable to read the joystick.
Yes..., they do run correctly on a friend's older cpu with a with 1.0 TOS.

Uniterm 2.0e from terminator.cc.umich.edu

It does everything that it is supposed to with one extra: after using
it for a while (especialy moving between many menus/screens/boxes) it
will start leaving small boxes (aprox[###]) arround after moving over
menu selections, and the mouse will disapear. Am I alone in this??
Other than that a great system.

My last complaint: The *#$@ mouse will swap up for down occasionaly after
swaping disks (in the short time that the pointer disappears while
redrawing a window) I can see no pattern nor is it easy to repeat
(it will revert to correct _sometimes_). Is there a patch?

My system:
1040 STf (the standard U.S. ST) 1.2 TOS, bought Dec. 89
1 meg, 1 drive, mono, no DA's or ACC's

What can be done? are there patches, new versions, or anything else??
how about loading TOS 1.0 into ram(how do I do this(please gime me source
not a discription))?

please email me...I'll repost summary.
thanks.

Uh, I hate to tell you, Philips owns Maganavox. Sylvania too.
Rather, Magnavox and Sylvania, is part of NAP- North American
Philips. A few years ago, they were once owned by GTE, but Philips
bought them.

On a side note, Zenith is the only American (practically) consumer
electronics company left. RCA is owned by the French (Thomsen) and
Sylvania/Magnavox by the Dutch. But no one says anything about the
Europeans, because they are white. But mention Sony buying
Columbia, and you hear xenophobic prattle.

But I digress...

1167. TOS 1.6, Piracy, STe.

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 10:25:16 UTC
From: D.Wade@sysd.salford.ac.UK
Message-ID: <.1.Feb.90.10
Source record: 244080

Firstly on the subject of Floppies. I have access to three 'IBM' compats with 3.5 Inch floppies. An AMSTRAD portable, an IBM PS/2 Model 70 and an Apricot Zen-i. Now the lattter two have 1.44 Meg disks in. They often have problems reading disk formatted on the Amstrad, (They too think they are 1.4 meg format.) so I suspect there may be a bug in DOS3.3 (which what all the machines are using). Also IBM released a 'patch' for the ROM BIOS in some PS/2 machines so if that is missing it might cause the problems. However disks formatted on my STE seem to work fine in the Amstrad and the 'real' IBM, but I have not done any 'extensive' tests.

On the subject of the STe one recent add I saw said they only had STe's. However we don't have FCC testing in the U.K. so I suspect thats the delay in the USA.

I think the piracy issue is a bit emotive. I guess one problem is that most PC's are used as part of some business activity. So they have a software budget, so if you write a PC package you stand a good chance of selling at least a few copies, so if some get pirated you don't notice much. (assuming of course its not a game). In fact most people I know with PC's have several pirate copies of very expensive packages that they 'copied' from their employers machine. With ST'S I guess the business market isn't there. So the piracy looks much worse. In fact I know several teen-agers with ST's and in general if they like a game they go out and buy a copy. In general they seem to have less pirated s/w than most 'personal' PC users.

Sorry no signature file but replies outside the UK may be sent to:-
D.WADE@D.SALF.AC.UK - Most Places, MS2@UKACRL - Bitnet.
P.S. I suppose I ougft to say the above is my personal opinion.
PPS. Ken, Any chance of getting the TOS1.6 Med Res Boot fix posted here or do I have to mail my disk to ATARI for a fix. (Nope the dealer I bought from dosn't have it in his local shop, his Tech Support center is moving house so I can't ask them until next week).

1168. OK, so they sell the STe in Europe...

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 10:55:00 UTC

Source record: 244082

So, Rich Covert is terribly cross that Atari have started selling the STe over here first, eh? Well, everything has to be sold somewhere first, and it seems fairly logical to release the STe in the area where ST's do best. Why should everything be sold in the USA first? The idea that this degrades America to the status of a Third World Country is a) insulting to LDC's, b) insulting to Europe (should we have got it after the USA to confirm our status) and c) indicative of the sort of inferiority complex that hardware scrolling won't cure.

Honestly, some people.

From: croes@fwi.uva.nl
Message-ID: <397@fwi.uva.nl>
Source record: 244098
Cross-posted to: comp.os.minix,comp.sys.atari.st

Hello QL users everywhere,

Thank you again for all your replies. Clearly the QL is not dead yet! I even got reactions of the sort "I have allways been considering to buy a QL, with Minix working on it I certainly will".

Let me emphasize that the current version is *not* going to be distributed in any way. It is about four times as slow as on the ST, supports only 720K disks, and all the bugs are not out yet. Many things can be and should be improved.

Due to circumstance and lack of time I am not able to do further work on Minix QL myself. I am therefore looking for a person or persons who are willing to do this. Candidates must have:
- a Sinclair QL with
- at least 640K of memory
- at least one 720K 3 1/2" disk drive, Cumana or Cumana compatible (flp1_*d2d must work for reading/writing the whole disk)
AND
- a Atari ST with Minix
AND
- some way to transfer files from the ST to the QL (for example, XOVER).

You will need the ST to compile the kernel, and a 3 1/2" drive for fast file transfer. It is possible to work with a QL only, but this will slow down things considerably.

Anybody interested?

If your Formdial is the same like mine it works like this:

Formdial increases the speed of closing dialoges. If you open a dialog-
box Formdial saves the screen in memory. If you close the dialog, it
restores the screen.
The application needs no time to redraw the window under the dialogbox.

I have been running a local bbs on Atari ST for couple of years here
in Finland. Some of the BBS's youngest users don't speak English very well
and they have hard time understanding the functions of the bbs.
I have used Steven Grimm's BB/ST and now my system runs Michtron's Multiuser
BBS program. I have had good experience of both of these programs but
I would like to make things little easier for my users and get a Finnish
speaking BBS software. There are also other confusing things than language,
for example dates should be of form dd-mm-yy, not mm-dd-yy. Time
should be military time, not AM/PM form.

I don't know any commercial bbs programs which could
be translated TOTALLY (without serious hacking ;-)) into another language.

For best results I quess I should write my own piece of software,
or port some PD bbs on my system.

If there exists any PD bbs software INCLUDING the source code (Citadel?),
would you please e-mail me how to get these.

1) I recently found on a local BBS a program that supposedly formats Atari disks to 1 Meg (on a DS drive). Since I personally have never succeeded in formatting past 810K I was wondering if this program could really work or if it could really screw up a disk.

2) Has anyone been contacted by LFP about a refund to their now defunct subscription to ST-LOG? Or is it time for a long distance call.

From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9002020809.AA08491@ucbvax.Berkeley.EDU>
Source record: 244019

The best tool that I have found for cleaning up FAT's is Hard Disk Sentry from Beckenmyer Development tools. I find it essential because certain Atari programs (apparently including dBMAN) sometimes mangle the directory structure of a hard disk when they crash.

SENTRY is very good about rebuilding a mangled directory structure.

Michtron also peddles something in their utilities pack and ICD is selling a product called CLEANUP. I have not had any experience with either of these.

Andrew, save yourself the $40 and do NOT buy the TurboJet GDOS printer driver from Neocept!! Buy the GDOS printer driver set from Migraph instead!!

I know because I was foolish enough to buy the TurboJet drivers without asking first, and was it ever a mistake. First, the GDOS driver for my Panasonic KXP4450 Laser Partner printer does not allow complete grpahics on a page. I bought the shareware program IMG CAT from the author on GEnie and when I wne to print out a catalog of IMG pics d/led from GEnie it would only print 6 pics from page, the rest of the page was blank. I asked on GEnie about it and was told that the TurboJet GDOS driver was at fault. I went out and bought the Migraph GDOS printer drivers and everything now prints fine. I have been told that there are other programs which don't work well with the Neocept TurboJet GDOS drivers.

And to boot it all, the Migraph drivers were cheaper than the Neocept TurboJet!!

So, try to order the Migraph GDOS drivers and you will be happy!!

Standard disclaimers apply; i speak for myself.

Ken, you seem to really like Turbo C from the Germans. Have you tried
the Version 5 of the Lattice C from the English company Hisoft yet??
I am sure that others here would like to know what you think of the
vers 5 lattice c compiler.

I have asked my local Atari store to try to locate the Lattice C compiler, but
Michtron (who distributes other HiSoft products like WERCS and the C Interpreter)
does not distribute the Lattice C compiler here in the USA. So, my dealer is trying
to locate another source for it. Meanwhile, I wait.

Also, I hear that my dealer has a source for the commerical Flowcharting program
that is available in England. He says that he should be able to get it in a month
or so. I hope that it is as good as some of the flowcharting programs on the Mac, because
that is the only program that is out for the Mac that I can't find for the ST.

So, Ken have you tried the Lattice C vers 5 compiler? What do you think?

Thanks.

1189. Help Needed with MICRO RTX

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 16:37:49 UTC
From: gossa@chefs.dec.com
Message-ID: <8016@shlump.nac.dec.com>
Source record: 244038

Hi I need some help with installing MICRO RTX. (I can't evaluate it's usefulness to me if I can't even get it to work !!) .

I managed to assemble a .BIN library from the RTXBIND.S source by slightly altering it to fit my C compilers needs. (Assembled using HISOFT's DEVPAC 2 for LATTICE C v3.04).
The .PRG is in the AUTO folder on an otherwise blank floppy, (I Don't have a HARD DISK so there no problems there). On booting from the floppy the Copyright Notice is displayed and the system exits to DESKTOP, so it looks like the system has installed.
If I compile a simple program i.e. turning the code fragment for RTX_INSTALL into a program which prints out "Installed" or "Not Installed" then it compiles, links (with the MICRO RTX library) and executes without crashing but does not print out either of the above messages.
On Investigation using MON ST I discovered that the program was falling over at the TRAP #5 in RTX_INSTAll with an 'Illegal Trap' message. (Is this due to MON ST stealing/reseting the TRAP #5 vector ??). TRAP #5-#15 all point to the same address is this correct ???
Is there something going on in the STARTUP of Lattice C which causes problems with MICRO RTX ?? I'd love to find out as the system looks like the answer to my dreams.

- Andrew (Goss) -

P.S My system is a 520STFM with 1/2meg intenal,1meg external drives and TOS v1.3 in ROM and is as bought.

Indead, BMS, SUPRA, and ICD are all in this pond.
I Like BMS, because I like dealing with the people there.
SUPRA and ICD will sell you a complete package.
The BMS is marketed direct and by EA Brown (Minneapolis,MN) who
will also sell you the box and boards to run your own drive.

1193. Big troubles with STEs ???

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 17:12:09 UTC
From: alex@hpgnd.HP.COM
Message-ID: <4280007@hpgnd.HP.COM>
Source record: 244026

Hi there,

I really get confused with all rumours I have heard about STE machines.

I have red that they do not work properly with a monochrome monitor.
Especially they would get lost if one try to use the new capabilities
(Hardware scrolling , new blitter) on a monochrome monitor.

It is a famous French ST magazine "ST-Mag" which wrote that...
It seems there are some big problems with STEs.

They have also written that external drives 3'5 and 5'1/4 could not be
accessed properly with STE machines .

Has anybody met these problems with STEs on monochrome monitors or
with external floppies ?

Is it a hardware problem or a TOS 1.6 problem ?
Is there the same problem on TOS 1.4 machines ?

Will STACY allow external 5'1/4 disks ?

Thanks a lot for your answers.

1194. Re: Tick-tick-tick-CRASH! is not dead in TOS 1.4

grahamt@syma.sussex.ac.uk (Graham Thomas) writes:

| GST say it's something inside TOS (or GEMDOS or whatever layer
| it might be), so I was rather hoping the problem might go away with TOS
| 1.4.

Now why doesn't that surprise me? Not to bash GST, but I have found
that a lot of problems similar to this are a result of bad programming
practices. Not intentional, but just because the developer wasn't
aware of some restriction or another. It's all too easy to blame TOS.

I would like to know exactly how the GST products get their keyboard
input, in gory detail. *IF* I knew that, then I might be able to
figure out what causes the problem. I strongly suspect that the
problem is caused by mixing input modes between AES/VDI/GEMDOS/BIOS.
That has been known to produce results like this. If it is _not_ that,
then there is a good chance that it _is_ a bug in TOS, and I want to
fix it!!!

| People can go for months without it striking, and then have it
| happen twice in a day. (Sunspots??? :-))

Yep, sounds a lot like the ol' cosmic rays. It is really unfortunate that
this particular bug is not easily reproducible. Of course, if it were,
it would probably have been fixed long ago... :-/

| I'm waiting for the bug to strike while I'm running Wordplus from within
| NeoDesk, so I can try sending a few wind_update() calls. Would this do
| any good?

While you're at it, don't forget to sprinkle the chicken's blood on the
keyboard and dance about, chanting at the monitor.

1195. SAMPLERS: The one that I want...

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 17:17:00 UTC
From: ZDEE050@elm.cc.kcl.ac.UK
Message-ID: <9002270812.AA13603@ucbvax.Berkeley.EDU>
Source record: 244027

SAMPLERS: I have been trying to find a decent sampler at "the right price".
What I need is something a bit more professional then the likes of REPLAY
(8-bit, mono, minimal MIDI, designed for L-M Rez gaming types....), but not
quite up to ADAPI,II,AKAI-S900 spec.

In fact, what I could do with is (in order of importance):
At least 2 outputs (pref 4) and able to bung different sounds down each.
A good MIDI control - not just note on/off, pitch etc, but control too.
Support/upgrades etc.
12 bits (though 8 can still sound good)
Good Mono display.
Priced 200-300 quids. (Pounds Sterling to you across the pond....)

I have looked quite a bit, and no body seems to have a package to fit the bill.
I had hoped Germany would have something - Their stuff is generally 10-20 times
better then UK offerings, but my best chance seams to be the ProSampler by
Galaxy coming out in March (so they say...). G-Datas' AS sound sampler III is
16 bit MONO! no good for me.....

As for the Britsh offerings, Tony Racine at AVR has some good ideas, except
that he does not think the market exists for what I want. I put this down to
him not knowing about the recording industry. (Think: Most Studios have at
least one ST (for running Pro-24 etc) so a good sampler using a Mega as control
and memory would really sell. If the studios use them, bedroom studios like
mine will too to maintain compatability)

The biggest joke is POWER COMPUTING (I noticed that someone else on the net
seems to question this firm....). They "market" MOUSE MUSIC, which on paper
looks good (8 bits only, but Stereo, so more than one ouput), but talking to
various people (including Chris, the programmer) got me worried, there were
problems they said.... So I asked Power Computing for a Demo. The weeks passed,
Ken (of PC) kept saying it would be with me of friday/friday/friday etc. What
finally convinced me was when Chris left the company - after falling out with
the hardware designer! I would never now touch Power Computing with a
bargepole, a very very long one too!

So: If anyone out there knows of a Sampler that has multiple outs, please let
me know!!!

Thanks,

Fraser Stephens, UK.AC.KCL.CC.OAK::ZDEE050

1196. Re: Want pseudo-trap handler examples

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 17:27:01 UTC
From: kbad@atari.UUCP
Message-ID: <2016@atari.UUCP>
Source record: 243906

saj@chinet.chi.il.us (Stephen Jacobs) asks about critical error and terminate handlers.

Intercepting the critical error handler is simply a matter of grabbing logical vector 0x101 using Setexc(), and doing the appropriate thing with the arguments sent to your error handler by the bios. This is documented in the GEMDOS manual in the "extended vectors" section.

Grabbing the terminate vector to "recover" from a ^C is not the way to avoid having ^C terminate your application. Use GEMDOS raw i/o (Crawcin() and/or Crawio()) and roll your own string reading routine.

>Look at the list of software that wouldn't run on the Megas! You bought a
>piece of software for an ancient IBM PC, it worked on a PS/2. period.
Ah, no. Yes, most of the material that SURVIVED until now from that
era works - because people followed the (few) programming guidelines that
would help insure that slight differences would not crash their code. The
ST is a more complex machine and has more rules (which doesn't excuse the
problem; published guidelines are published guidelines, and if the software
doesn't follow them, that's not Atari's fault) and therefore more violations
of those rules - and more crashes upon grades.
I do remember software that wouldn't run on the AT, much less a PS/2...
fortunately, I haven't seen any of that kind of material in quite a while.
It's not just Atariland where this happens. I use Amiga systems (three
at the home/office right now) and haven't had any problems when upgrading,
except with a couple of games (and we know who you are, Psygnosis! :-( ).
However, there are others out there who have had this happen. So the problem
is everywhere; people just don't pay attention to the rules.

My personal opinion about this screen saver are mixed. I like the concept, but
it has this strange problem of messing up screen draws (even the GEM Desktop).
I have found another program, which instead of having starbursts, has the
Atari fuji symbol. I'll post it to comp.binaries.atari.st and see what
everyone thinks...

I am currently using the EPSON LQ Printer Driver which I purchased at an EPSON dealer here locally. As I recall, it cost around $45. The program came on two MAC disks and included System 6.0.2 , as well as a cable to hook a MAC PLUS to the printer (I sold mine to someone for $10, which made the driver a bit more affordable.) As there is mention made in the manual about a program called Printworks, I believe this program was used to write the driver originally, so buying Printworks might be another option. The driver works in 180 x 180 and 180 x 360 modes, and does a very good job printing. ATM does work quite well with it. As far a Imagewriter emulation goes, the driver uses standard MAC fonts, but for good print quality, you must have a font 2 1/2 times larger than the one you wish to use installed in the system, i.e. if you want to use a 10pt. font, you must have the same font installed at 25pts. There is also a desk accessory included to allow you to match the internal fonts of the printer to the screen fonts of your choice....

I have ICD CLEANUP, and it did save me lots of times.

However, there is one small catch (I believe). It only works with ICD host adaptors.

I can't confirm this, as I only have an ICD, but I remember trying to run it off of floppy when my hard drive was really on the fritz, and it said 'no ICD host adaptor present' and aborted. (the DMA bus was locked, I think)

From: ogicse!blake!ramsiri@ucsd.edu (Enartloc Nhoj)
...

in updates. The current version is 2.2 which includes the new

"Softlink" program- a partitioning/multi-tasking piece of code:
YOu can create up to 9 separate partitions for GEM or TOS each with
a virtual desktop... The "multi-tasking" feature is ONLY with
respect to the added ability of NOTOATOR being able to run concurrently
with a word processor etc.. in other words.. one can have NOTATOR
playing sequences in the background while you write a report..
In addtition, if you have another midi program you like to use..
NOTATOR can record all midi events being generated by the "other"
midi program.. that's pretty slick. ANyway, i don't know how
good the task switching abilities are.. nor if the "multi-tasking"
features are reliable...

I have used the features in "Softlink" and I'm not terribly impressed. It is
nice to be able to get back to the desktop and run some simple things without
having to exit out of Notator but I have found that I lose certain things when
switching between partitions, like the state of the key click. Also, I have
yet to find a MIDI program that works with SoftLink. I didn't expect my
hostile Dr.T patch editors to work but TurboSynth, from Digidesign didn't
work! I was able to bring up the program and do all the normal operations but
I could not use any MIDI functions in TurboSynth. I have reported these
problems to Digidesign. Softlink also requires a minimum of a 2 meg system
and with that you can only have 2 partitions, Notator and one other partition
of around 700KB. Things are a lot easier with a 4 meg system.

I will say that I have been impressed with the support from Digidesign for
Notator. I have received several timely updates from them for free or a very
reasonable cost. The update to 2.2 costs $30 but I did not have to pay for it
since I had reported several bugs that were to be fixed in that release.
However, the most glaring of the bugs, severe timing problems when playing
MIDI format files, is still there. Sigh, maybe someday I will be able to
import files from other sequencers.

>it could really screw up a disk.
>
This may be possible with some really packed disk formats, but the media
would be highly unreliable. I have seen formatters go out to 83 tracks,
11 sectors reliable ON PARTICULAR DRIVES. You just have to experiment
and see how much stuff you can cram on a disk reliably. I have found
that 82 tracks, 10 sectors, twisted works fine for me and most of the
other drives I encounter, but I still run into one occasionally that will
not read a disk. It seems to be the track number that gives drives
problems, anything above 80 is not guarenteed. I use 80 tracks, 10 sectors
twisted for anything I would cry over if I lost, just to be safe.

I believe the GNU C++ compiler has been successfully ported over to the
ST domain, and I also understand that the FSF is developing interest in
ST's (net rumor). Another nifty story is their response to Apple legal
silliness.

```
|
|Coderam, included on the Codehead Utility disk, is the best ramdisk program
|I have used (of many). It is reset-proof (really), and supports many different
|sized partitions (from a menu at bootup, will go to a user-default in about
|5 seconds). This program, along with the others on the disk, are well worth
|the price. These guys churn out some of the freshest and most useful code
|for the ST's.
|
| Mickey Boyd
```

Another recommendation for CODERAM (and the Codehead Utilities). I just upgraded to the latest version. It not only is resetproof, but it supports drives A-Z, can overlay with an existing drive, can use the blitter to make it even faster than a regular RAM disk, can be used as a boot disk... and some other stuff I can't recall. I don't recall the size limit, but it is in excess of 1.5 MB.

1211. Emulators, et al...

Newsgroup: comp.sys.atari.st
Date: 1990-02-01 20:53:46 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900201.14534518.019609@SFA.CP6>
Source record: 244037

Tom Bellucco writes:

"Let's compare apples to apples here...it makes sense to want 3 seperarte
items that perform their tasks perfectly than 1 item that performs 3 seperate
tasks half-ass."

This is in reference to running emulators on an ST. In my biased
opinion, it depends on the quality of the emulator. I'm running Spectre
GCR, the Macintosh emulator on a monochrome monitor and the end result
is a faster 3.7 megged Mac Plus. I run PageMaker, FullWrite, and am
typing this letter via my RedRyder 10.3 terminal program for the Mac. As
far as all end results are concerned, my ST is a Mac while in GCR mode.
The only 'half-ass' job is in the fact that the emulator is lousy at
copy protected games which I could postively care less about. I use the
ST side for games, if need be. David Small has so extended my ST that
I have two computers on my desk.
Extension of the computer is what emulation is all about. We are
fortunate that Spectre GCR is so solid that the extension actually turns
the computer into another system. Tom's statement is just not correct
as far as the GCR is concerned.
Indeed, I have FEWER CRASHES which using the GCR than I do while in
native host ST mode. by crashes, I mean the cute little cherry bombs and
this is with TOS 1.4, which has made my ST even more solid that it
originally was.

"Look at the list of software that wouldn't run on the Megas!"

WHAT LIST????? I've had a Mega2 ST since December of 1987 and I've
yet to run across any problems. Are there problems with games, where
is the difficulty? Someone tell me so that I can convince the software
that I use that it is not supposed to run. Typical software that I
use daily is Flash 1.61, WordPerfect, Dungeon Master, Blood Money, Xenon II,
HotWire, Falcon, Populas, and all the popular utilities from the CodeHeads
and DoubleClick. I've lots more but these are the ones which come to
mind. Also note that I've been collecting ST software since summer of 1985
and haven't discarded anything yet. I do know that Arkanoid used to not
work, or something like that. I never had it anyway. Oh well...
Speaking of incompatibilities...
Since upgrading to TOS 1.4, I have noticed that Captain Blood stopped
working on me. Everything else seems clean to me. Anyone know anything?
Regarding emulation again... it is a concept allowing extension of
the host machine. We are fortunate in that we have such good emulators
that they seem to replace the host, the ST.

As a shareware end-user, I'd like to throw in my two cent's worth.

My assumption with shareware is this: "what you see is what you get".

I'm under no legal obligation to register AND the developer is under no legal obligation to fix bugs or enhance the product.

So, if I get a program that has too many bugs or otherwise is not fully functional, it gets dragged to the trashcan. No exceptions.

The last shareware program I registered for was SUPRBOOT. It is fully functional and I have not encountered any significant problems after several months of use. If it was never updated again, I would be happy.

Now, you (the shareware author) may disagree with my approach to this situation, but if you want my financial support, that's what it takes.

>there a reason for this?? any consequences if we set this ourselves.

It's not a "don't clear BSS" bit -- it's a "don't clear HEAP" bit! The BSS is the uninitialized storage your program declares that it will need: the C language guarantees that this will be zero, and the ST compiles by zeroing it when you're loaded. The REST of the memory you get allocated, above and beyond your declared BSS, is the heap. For reasons I do not know, GEMDOS originally cleared all of that, too. That's real slow on a 68000 with 4MB of memory, so I added that bit to tell Pexec "You don't have to clear my heap." Programs with that bit set load faster. Not all programs can stand it: MS Write, for one, expects all that space to be clear.

>apratt: how about sending out a binary diffs (a convenient way is to
>hexdump, and send out context diffs of the hexdumps) from the t1.4
>image, that fixes these problem, so that those of us with eproms can
>fix them. (i really hate auto\patches).

There is zero chance of this. Atari's policy is, "The only TOS we have to support is the one in Atari masked ROMs." If you have EPROMS, you don't have an Atari-supported OS. This way Atari gets out from under the burden of supporting whatever code happens to be in your EPROMs, with whatever "patches" and "fixes" and "improvements" you or somebody else put there.

Before you jump all over me, of course, I'm being pedantic. I know that real TOSes can be in EPROMs.

Source record: 244040

I have heard that you should format the floppy on the same
drive that you intend to do your file writing with.

Try formating the disk on the Atari using DC Format
or some other utility that allows you to use the
IBM boot sector. Then try again.

Most of my transfers are done in the opposite direction
from what you want. That is, I format the floppy with

format B: /N:9 /T:80

on the HP to get a 720 K format. Then I write the files
on the HP. When I take the disk home, I can read them
without trouble.

I hope that this helps.

I recently heard from my local dealer that the Stacy is going to run off of ordinary C-cell batteries! Also, the dealers should have them by March! Wow, I guess Atari doesn't want to be stuck-up like the other laptop makers and actually use rechargable battery packs! Now when your computer runs out of juice (about 15 seconds with a hard drive), you can run to your local thrifty store and pick up eight more! Gee, thanks !!!

>this file for input, that one for output." I had hoped that J.Bammi
>could win you over to this point of view.

Or you could just use MICRO RTX which has working Fdup / Force as
well as Popen (pipe popen) so you don't even need to use temporary
files.

For example:

```
int pfd[2];
int sav0;

sav0 = Fdup(0); /* save stdin */
Popen(pfd); /* create pipe */
Fforce(0, pfd[0]); /* force child to read pipe as stdin */
Pexec(100, "child.prg", tail, env); /* start child (fork) */
Fforce(0, sav0); /* restore stdin (child is running now) */
Fclose(sav0); /* release the saved handle */./

/* write whatever we want to pipe */
Fwrite(pfd[1], (long)strlen(data), data);

/* close write side */
Fclose(pfd[1]);
```

You could also use multiple pipes to run several programs in
a chain. You can also use Fdup / Fforce once on two different
programs and Pexec one to write to the pipe and the other to read.
For example, the equivalent (in simple terms) of the shell command
"prog1 | prog2" can be done with:

```
int sav0, sav1;
int pfd[2];

Popen(pfd);
sav1 = Fdup(1);
Fforce(1, pfd[1]);
Pexex(100, "prog1.prg", tail, env);
Fforce(1, sav1);
sav0 = Fdup(0);
Fforce(0, pfd[0]);
Pexec(0, "prog2.prg", tail, env);
Fforce(0, sav0);
```

```
Fclose(pfd[0]);
Fclose(pfd[1]);
Fclose(sav0);
Fclose(sav1);
```

1218. Memory Expansion (summary)

Newsgroup: comp.sys.atari.st
Date: 1990-02-02 03:34:21 UTC
From: mwjester@wsucsa.uucp
Message-ID: <12334@wsucsa.uucp>
Source record: 243932

A few weeks ago, I asked if there were any well-regarded memory expansion boards for the 1040ST. Responses were few but from all over (Europe, N. America, Australia); here is basically what I found out:

Frontier Software produces a 2.5M board called Xtra-Ram, available in Australia ($A200). My correspondent (Thanks, Rupert!) believes Frontier is an English firm; if so, this might be available in UK/EEC/Canada. The product is evidently quite solid.
Whoops! Almost forgot - that's the unpopulated price.

Datafree (Toronto) has a 2/4M board for the 1040, but it apparently was designed for some particular version of the motherboard, and the docs do not help if you have the wrong one. No price given; you may want to verify beforehand that it will work in your particular machine.

ZRAM (LA) was under consideration by one correspondent: price is right (US$119 unpopulated) and docs apparently good.

Tech Specialties (sp?), Houston - some folks swear by them, others at. My local dealer (no, not an oxymoron yet) has dealt with them over the past year and installed their boards, and says he has had no complaints with the product. Their catalog does have lots of info. If I go this route, I will do it through my local guy, having heard some of the horror stories in this newsgroup.

DISCLAIMER: I am affiliated with NONE OF THE ABOVE. The sample was very small, so the evidence is more anecdotal than statistically significant. Your mileage may vary.

I had some email replies bounce, so I would like to thank all who replied.

The next version of Fido will be multi-lingual. You will be
able to port it to any language you want via text configuation
files. This will include "ANSI" (note quotes) escape sequences
to paint different colour text and graphics.

As soon as it comes out, I will upload it to SIMTEL. Look
for "Fido 12s".

(in response to someone saying how terrible the 1084 is)

Just to avoid any confusion, I'd like to say right off that you're a
dick. Second, advertising ELITE BBSES!!!!!! in your name is generally
regarded as being juvenile, especially if you're posting to the net
and said ELITE BBS!!!!! is a pirate board. Finally, you should really
take care of that Caps Lock problem. Loose wires can often cause
strange artifacts such as those reproduced immediately below.

-> I WOULD like it if you would post the "PROBLEMS" you and "OTHERS"
-> had with it and WHY IT WAS SO "TERRIBLE"...

I've got a 1084, and I don't really hate it 'cause it's not a bad
monitor for video work. However, it's got a few problems like
occasionally screwing up interlaced pictures badly by, well,
de-interlacing them. The result is often an unreadable flickery
screen. You wouldn't see this because your machine only does 320x200
in color (IE on a 1084-like monitor). (Unless your ELITE!!! machine is
actually an 8-bit, in which case it's marginally less.) It can be a
pain, in any case.

Gotten any rad kuel bitchen new warez lately?

>to MON ST stealing/reseting the TRAP #5 vector ??). TRAP #5-#15 all point to
>the same address is this correct ???

I have the same problems in my Turbo C-Environment. At least I can
test the programs after leaving the environment, as Turbo C restores the
vectors. I temporary solved the problem by writing a tiny program which
copies the trap-vectors to the area of user-vectors, befor starting the
C-environment. I changed the RTX_INSTALL-function to set the trap-vectors
back to these vectors befor executing the trap. But I still hope for a
better solution.

Good luck.

I doubt if Atari are going to buy this idea, nice though it is. I would prefer
if they started shipping out complete fixed images to subsiduaries now. Just
like they did with TOS1.6 when they found some real showstopping bugs.

The bugs must be in fixed ROM version 1.5 at Atari so why not?

>(i really hate auto\patches).

Yup! Me too! But I would love an \auto path to make our 21 TOS1.0 ST lab
a bug free one.

The general concensus of opinion here is that TOS 1.6 would have been better
called TOS1.4E. Unless of course 1.4 is the end of the road for us old ST
owners and future revisions will only be for STE's.

Source record: 243930

Recently I received the GNU c compiler for the Atari ST. Unfortunately it
came without any (not even a readme) documentation. I have been experimenting
with running it from gulam, but sofar this hasn't been very succesful. My
guess is that I have to set up some environment variables, but I don't what
variables are needed.

Maybe somebody can help to obtain this info. A source for the documentation
of Atari GCC is also appreciated. (Cannot ftp unfortunately).

Yes, this *is* a known psychological phenomenon. Anyone wishing to know more (those "enquiring minds", for example) should look up Festinger's cognitive dissonance theory and the empirical work surrounding it. Doesn't explain anti-STE attitudes adopted by journos though, they shouldn't be affected by cognitive dissonance, not being personally involved in resource expenditure decisions (the engine of cognitive dissonance).

Hi there,

I really get confused with all rumours I have heard about STE machines.

I have red that they do not work properly with a monochrome monitor.
Especially they would get lost if one try to use the new capabilities
(Hardware scrolling , new blitter) on a monochrome monitor.

It is a famous French ST magazine "ST-Mag" which wrote that...
It seems there are some big problems with STEs.

They have also written that external drives 3'5 and 5'1/4 could not be
accessed properly with STE machines .

Has anybody met these problems with STEs on monochrome monitors or
with external floppies ?

Is it a hardware problem or a TOS 1.6 problem ?
Is there the same problem on TOS 1.4 machines ?

Will STACY allow external 5'1/4 disks ?

Thanks a lot for your answers.

> Am I being paranoid, or has there really been a proclivity on the part
> of the press (UK and elsewhere) to slam the STE??? I've heard more
> negative rumours and outright lies about the STE than any other recent
> Atari development. I wonder why this is?
>

I too think the STE's been slammed a little unfairly. Perhaps it stems from confusion about some of its features, leading to over-high expectations. Some people thought the STE would be able to display lots more colours on screen at once, without special tricks. When they found out you could still only have 16 in low-res (albeit from a wider choice) they were disappointed. Premature references to an 'Amiga basher' increased this disappointment.

Also, the way they were introduced in the UK didn't help. They came in 'through the back door' without any proper announcement (and, in one version I heard, as a result of Atari UK's bad estimates of the amount of stock they'd need before Christmas).

It doesn't help either that the STE doesn't come with its own manual (there's a loose 'addendum' sheet to the STFM manual), doesn't come with any demo programs (or even an enhanced control panel accessory, I think) which take advantage of its new features, and doesn't come with any of the fixes which Allan Pratt posted here a while ago. Non-technical users who are bothered about the bug that prevents bootup in medium-res first have to find out about the fix then have to get it from somewhere - which isn't always easy.

No doubt later shipments will overcome these teething troubles (well, we live in hope). In the meantime, just to show all is not doom and gloom, I have a friend who's just bought a 1040 STE and is really pleased with it.

>
>Kees van Reeuwijk

They certainly aren`t mythical here in the Great White North. My favorite Ataridealer has had 1040 STE`s in stock for over a month now.

At least, I`ve never seen an ST with stero outputs, extra DB9 ports everywhere,and SIMMs on the motherboard... :)

To be fair, the first ones they received came with the regular 1040STf manual,
and the control.acc did not access the extra colours available. Just a short
addendum sheet telling us that more info would be forthcoming, and what
"All them thar extry holes iz far"...

So I suppose the moral of the story is: Thumb your nose at the FCC, and take
a drive accross the border to Friendly Free Trade Canada, and buy `em now.

>practices. Not intentional, but just because the developer wasn't
>aware of some restriction or another. It's all too easy to blame TOS.
...
no fair, Ken, it's not GST's problem.

About a year ago I posted this same problem with Word Perfect Atari.
It too drops into "slow mode" now and then, when it eats up the keyboard
buffer about one key every few seconds, treats the screen as if the
mouse button were stuck down, and if you're lucky lets you (slowly!)
request a save before you have to reboot.

Word Perfect Corp. says it's a problem with TOS. The net-consensus was
that it's a problem with TOS. It occurs in numerous GEM programs, such
as Word Perfect and 1ST_WORD+. It is VERY frustrating, and is one of
the main reasons I bought a PClone recently! MS-DOSs eats it raw but
at least it gets debugged.

It takes maybe half an hour to an hour running Word Perfect to get the
bug, though I'm sure it would take a lot longer if somebody were trying
to debug it... Now would anyone from Atari like to try to FIX it?

>While you're at it, don't forget to sprinkle the chicken's blood on the
>keyboard and dance about, chanting at the monitor.

Funny, Ken, but that does seem to be about the right way to keep an
application running on the ST!

>reduced price. The latest release of the developer documentation is
>professionally printed, indexed, and includes several new addenda.

(Reduced from $300, for those not following this thread)

I would be interested in knowing exactly WHAT this "significantly reduced
price for the documentation alone" is. Is it on sale to the general
public? Or do you have to become a Registered Developer (complete with
non disclosure agreement) in order to see a word of it?

I have spent some time studying the original (circa 1985) developer's
documentation, and, in my opinion, it is a badly photocopied, badly written,
incomplete and misleading set of junk.
I'm very glad to hear Ken say that Atari are finally getting round to
producing a decent version. Only 5 years late, I guess..

(All this may be complicated by the fact that I'm in the UK, and Atari UK
are generally regarded as even worse than Atari US...)

Finally, may I say that I am not trying to criticise Ken or any other of
the Atari employees who spend some of their time being "visible" on the
Net. I have two Ataris (one being repaired :-), I like them, but I think
the level of technical information freely available to anyone - general public
or developers - has been appalling ever since the ST was released.

1247. MicroEMACS 3.10 Cursor/Bell

Newsgroup: comp.sys.atari.st
Date: 1990-02-02 16:42:22 UTC
From: chrisl@fulcrum.bt.co.uk
Message-ID: <B#3Y4*@masalla.fulcrum.bt.co.uk>
Source record: 243954

I've just compiled up MicroEMACS 3.10 on my ST (Using MWC), and at first
I thought all was hunky-dory. Then I went and used it on another machine which
happened to have the monitor sound turned up (mine's turned down 'cos I don't
like keyclick). Imagine my surprise when, every time the cursor was XOR'ed,
a sound like a chiming bell was emitted. Not the normal beep/click sound, but
a *really* annoying bell sound. I then tried it on my own machine with the
sound turned up, and it does exactly the same. I hate it!

Has anyone else experienced this? If so, what the heck causes it? I can't
see anything obvious, and I've certainly never come across it in the
documentation anywhere. All help gratefully received.

Thanx in advance,

-Chrisl.

True...however, it seems strange that they would be available here in
Canada but not just a few miles to the south (USA) - especially since
they should be the same machine (same power supply, same video, etc.).

>readings (ie. bad sectors where there were none). Others in the local
>atari club (San Diego) have reported the same thing. Be careful...

Here is a question about the 16 meg partition limit. I purchased an
Atari Megafile 60 a number of months ago. From the part number I
believe it used a Seagate drive. The manual that came with it
mentioned the 16 meg limit, however, the utilities which came
with it allowed me to make larger partitions. I decided to experiment
with this. I made a partition a fair bit larger than 16 meg (I believe
it was about 24 meg but I don't recall for sure) then tested it by
copying a program onto it multiple times (giving it a unique name each
time) and then reading the files (actually some selected copies of it
from throughout the hard drive) and everything worked fine. I have
kept my large partition and have not had a problem with it yet (although
I also haven't filled more than about 11 meg on that partition, except
of course during the test I mentioned earlier).

Does anyone have comments on this? Did some of the later versions
of TOS 1.0 or 1.1 or whatever it is in my 1040, allow for larger
partitions? Did some of the later versions of the driver program
allow for larger partitions, patching TOS appropriately? Did I
just get lucky during my test and is my >16 meg partition going
to be unreliable for long term use? I am being sure to back
everything up on occasion (usually every 4 months unless I add
something significant to the drive in which case I back it up
immediately following the installation) just in case. (Actually
I would do this anyway.)

So...if you like rechargeable batteries, buy rechargable C-cell batteries
and a recharger! If you think it's a waste and will mostly run the Stacy
from an adapter or something, don't bother.

Some might argue that using ordinary batteries is even better than a
custom rechargable battery pack since you can use the 'fast' rechargers
advertised by some companies. On the down side, you will have to
actually remove them in order to recharge.

Can anyone of you people out there tell me the answer to the following
brainteaser???

Ok, you are in a Jungle and it is getting dark. You must find
your way out of the jungle. In the Jungle lived two tribes, one tribe
is good and always tells the truth while the other tribe is bad and
alway tells lies. You are on a dirty path and came upon a Y-intersection.
Right in front of you is a sign pointing right and reads "This way to
Safty------->". Behind the sign is a native, You can only ask him
one question with a yes or no Answer to determine if the native is telling the
truth or lie and determine which way is the right way out of the jungle.
Remember you are Allow to ask only one question and it must have a yes
or no anwer.

If you have an answer, please tell me by sending it through e-mail!!
Thank you!

Those would be HDX 3.0. HDX 3.0 allows partitions up to 1 GBy (that's 1024 MB in case you didn't know.), It also allows more partitions per physical drive.

>partitions? Did some of the later versions of the driver program
>allow for larger partitions, patching TOS appropriately? Did I

See above.

>to be unreliable for long term use? I am being sure to back
>everything up on occasion (usually every 4 months unless I add

>I would do this anyway.)

The only problem, however, is that many disk utility programs, such as DL II, and TuneUp(i think), don't know how to handle the larger partitions. Make sure you find out if a utilities package can handle the big partitions before you fork() out $$$$ for it. You might not get your money back.

Yes, G++ exists for the ST. It's available from terminator.cc.umich.edu
for anonymous FTP (archive server too I think). However, it requires
at least two megs of memory, and preferrably four.

>multi-tasking sorts of things. What is available?
Two major setups to try out. Dave Beckmeyer's just released his Micro-RTX kernel as shareware. Of course, to take advantage of it, you need some software that'll do the right system calls. You can buy his MT C-shell, which would probably be a good idea anyway, if you like a Unix-style environment. Or you can hack up your own shell to use his code...

> What can you tell me about 16Mhz 68k retrofits for the ST?
>What is the best board in your opinion and what will it cost? What
>are the pros and cons of buying and installing a 16Mhz board?
Jim Allen's Turbo-16 board (Fast Technologies) is probably the only one worth looking at. $300, but 100% speed increase.

Btw, I'm not affiliated with either of these guys.

RDY from MWC also comes with complete source code. You should look at it sometime.

Anyways, I'd guess you were only trying to use RDY from the GEM interface. There's no fixed size limit in the RDY program itself, those are just the limited choices you get from the dialog. I set it up from the command line; used 2 meg with no trouble at all. In msh, try:
rdy CMD=MAKE DISK=M SIZE=1500
or something like that...

>Remember you are Allow to ask only one question and it must have a yes
>or no anwer.

"If you were from the other tribe, would you tell me that this sign
really does point out the way to safety?"

If the safe path is path A, and the sign points down path A:
A truth-teller will say no, as he realizes the liar would lie.
A liar would also say no, as he would have to lie.

If the safe path is A, and the sign points down B:
A truth-teller will say yes, and a liar would also say yes.

Whichever answer comes up, take it at it's opposite meaning. In this
situation you are combining a truth with a lie, which gives a lie, just as
1 * -1 = -1. Hope this helps.

1268. Floppy drive 1.44 meg woes!

Newsgroup: comp.sys.atari.st
Date: 1990-02-02 22:24:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9002030029.AA23185@jade.berkeley.edu>
Source record: 243975

I'm haveing a few problems hooking up my 1.44 meg teac. I was wondering if anyone could check some things for me. My problem is that i cant access the HD mode of the drive but the DD is ok. (My setup is a mega, useing the teac as drive B and a simple manual switch for changing HZ.)

What i've done so far:
1)Moved jumper on teac, setup is now jumpers at D0,and OP.
2)Took line 19, CLK, off the WD 1772 and the 8hz from the same.
3)Took line 39 off the shifter (right 40 pin chip?) for the 16hz.
4)Put a manual swith so that CLK and be choosen as 8 or 16hz.
Thats it....

Symptoms: Drive will not work in HD mode but will in DD mode.
When formating, -8, or -6 is returned. (sector not found/ or seek error)

I'm lost as to what to do now. Every thing seems to check out. Since some are using the same TEAC drive, i was wondering if anyone could double check my settings.

Any help would be apreciated.

PS: Bitnet sometimes goes out at my location. If posting a message, please send a duplicate copy to my mail box.

1269. MX2 Multitasking Kernel Problems

Newsgroup: comp.sys.atari.st
Date: 1990-02-02 22:36:34 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <947@watserv1.waterloo.edu>
Source record: 243967

Hello. I recently downloaded MX2 to be used in a Gulam
enviornment. Now, I'm no programmer and the manual that came with
the distribution looks like it's written for a person who is intimate
with the system. I can type 'mx2' from the shell alright, and things do
happen, but I can't seem to get processes to run in the background or at all.
All I can really do is start cli and login, get a new shell, at that's
it. Maybe I am confused, but am i not supposed to be able to set
processes running (any processes?). This doesn;t seem to happen.
Can somebody please set me straight and/or give me a little tutorial on
how to use MX2? Thanks.

1271. A Better GIF Viewer?

Newsgroup: comp.sys.atari.st
Date: 1990-02-03 01:41:51 UTC
From: jjung@nunki.usc.edu
Message-ID: <7814@chaph.usc.edu>
Source record: 243977

I've recently become interested in GIF pictures. But the problem I have is that all the GIF viewers I've seen are limited to only showing images as big as the screen allows. If the GIF picture is in any way bigger than the screen size, then the whole picutre gets squished one way or another.

So, all I want to know is : Is there a GIF viewer for the ST's that will _not_ condense the picture down if it's bigger than the screen size? (I imagine such a thing would use either a window system or the arrow keys to allow the user to scroll through the whole picutre without loss of resolution.)

Post or E-mail any responses you have. (If I get no replies, I guess I'll just have to wait for the STe or the TT to come out in the U.S., maybe they'll be able to handle GIF pictures better! :-)

Thanks in advance.

John

From: bammi@dsrgsun.ces.CWRU.Edu
Message-ID: <BAMMI.90Feb2212620@dsrgsun.ces.CWRU.Edu>
Source record: 243938

i guess i should add my two bits :-)
i expanded memory in my 1040 using a John Russell Innovations
SIMMS based expansion board. the board lets you use either 1M Simms or
256K Simms, but you cannot mix them. There are four Simm sockets on
the board, and you can populate either 2 or all 4 sockets. It will
accomodate either the x8 or the x9 Simms (they can be 80ns, 100ns or
120ns simms, 150's will work too,but are not recommended, and are hard
to find in any case). An additional feature of this board is that it
comes with sockets for two shifters. you pull the existing shifter out
of its socket and install it in one of the sockets on the board. you
can optionally buy a second shifter, and plug it into the second
sockets for an expanded pallette (the board comes with software to
support the JRI 4096 color technology).

installation is quite easy if you are the handy type (6 solder points
and two headers, took about 30 min total). it fits (very snug) under
the shield (low profile SIMMS are *really* required for this). i have
had the board in for over a month, and its been doing great. to me it
made a lot of sense to use Simms instead of discrete chips, as they
can easily be re-used or moved to other machines, including future
atari ones. (they are quite cheap too now -- $85-90/1M Simm -- look at
the ads in computer shopper).

JRI can be reached at:
john russell innovations
PO Box 5277
Pittsburg, CA 94565 (yes, pittsburg CA not PA)
(415) 458-9577

Unpopulated board costs $125 + shipping

A simple question really: Does Excel 2.2 run on a 1 meg ST with Spectre? I can't seem to get it to run...I seem to get some sort of "bus error". You can post to the net, or email to me directly. Thanks very much (as always!).

Digispec, a desktop accessory included with the Computer Eyes Digitizer (I think) will give you the option to view the top, center, or middle. You can also adjust colors and grey-scale values, and reevaluate the picture with the new colors/intensities. It will also allow you to save the pics in Spectrum format. Only problem is that I do not think it is available by itself (I am not sure on this one).

1277. HELP: ICD HDUTIL.PRG

Newsgroup: comp.sys.atari.st
Date: 1990-02-03 04:31:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb2.233343est.58642@ugw.utcs.utoronto.ca>
Source record: 243941

I set up a new ICD 85 meg FA.ST drive and everything was OK until I formatted partition H (the last one) as a Spectre partition. Now my system will not boot from HD (the same problem happened on SH204 and Megafiles when a Spectre partition was set up).

I tried to run the ICD HDUTIL.PRG code but I get two bombs. The disk seems to have come in damaged.

Could someone E-mail me UUENCODED copies of the .PRG and .RSC files for HDUTIL so I can set up the HD to boot from HD again?

As an aside, I am still trying to get more info on Dave Small's comments about an Appletalk board for the ST. Is this a Mega only board or can it be put into an ST?

>actually remove them in order to recharge.

I was mainly trying to say that this tends to make the Stacy look like the kind of product you might find in a toy store, albeit a $1500 toy. Tandy, a company known for its overpriced products, has a laptop for $1500 that comes with two drives, P/S ports, internal slots, and a rechargable battery pack that charges in one hour. And also, who in their right mind wants to carry around a charger that can hold 8 (or more) batteries! That would be at least a third of the size of the laptop intself! If they included an internal FAST charger, that would be different, but C-cells are an inefficient use of space. Battery packs can hold more and take less space.

> display any messages or anything, just exits. Programs like that make me
> nervous.

I agree that the documentation for FormDial is minimal, or non-existent.
Which is unfortunate, since it's an interesting idea. What it does is to
speed up screen redraws (make them instaneously, actually) after you CLOSE
a dialog box. It does this by reserving a 32 kB chunk of memory (and you
thought it took only 500 bytes!), where it saves a portion of the screen
during a formdial (reserve, ...) call which preceeds a dialog box draw.
Then it intercepts the formdial (free,...) call and blits the image back
when the dialog exits, avoiding the redraw.

The reason it displays no messages is that it's intended to be run from the
AUTO folder. If you don't know that, I can see why you'd be nervous. Ac-
tually, you should be nervous of *any* program of doubtful parentage, with
no documentation!

If your dialogs commonly cover fairly small, or simple areas, you may not
notice the speedup very much. If they tend to cover very large, or complex
areas that takes lots of time to redraw, you will notice it. But you might
not attribute it to FormDial, unless you know that is what it's for.

Most programs work OK with FormDial, but some don't and will hang, probably
because they got sloppy and don't balance their calls to formdial properly
(just my guess). Whether it's worthwhile for you will depend on how tight
memory space is, and if you ever run ill-behaved programs that cause it
to hang.

Nope, not actually the dialog box draws. They're done at the same speed as usual. It's the *redraws* when the dialog boxes are closed that get sped up. By a lot.

I scratched my head over this a while myself, since QuickIndex indicated that dialogs were running almost TWICE as fast. I watched REAL close, but couldn't see any difference at all in how fast they were drawn. Then I noticed how fast they were closed. Bingo. See my previous posting for other comments.

Try setting the option for absolute calls. The problem you're encountering stems from the compiler setting everything for PC-relative calls and Gnu BISON is simply too big an object for this to work even though the separate functions may compile just fine. Don't nail me on it but I think that's the -P option.

Best of luck.

I noticed a mention of Chaos Strikes Back maps on this group recently, but all personal mail I've tried to send to track them down has bounced. I'd be very pleased to receive information on BBSs which have such information or preferably copies of such map files.

We have a group here that is struggling through, but we cannot easily communicate among ourselves without a map reference.

Any help would be greatly appreciated.

Thanks in advance.

Larry

A few questions for you atari hackers out there...

First, how can I read a character from the keyboard without echoing it to the screen? Currently, I am polling the keyboard with bios(1, 2) which returns a -1 when a key is pressed, then reading the key with gemdos(1) which echoes it to the screen. Is there a function similar to gemdos(1) which will give me the value but not echo it to the screen?

Second...can someone describe the parameters for xbios 8 and xbios 9 (Floprd and Flopwr)...I'd like to use these to make a disk-to-file-to-disk conversion program but the only docs I have on system calls for the st is a header file (OSBIND.H) ... not much to work with. Anyone know of a text file anywhere that has at least some description of these functions?

Thanks,
nick

The new version of Fido, 12s, and the upcoming (17 March) version of Opus are multi-lingual. There are utilities to translate all commands, prompts, etc. into most languages. I do not believe any of the test crew for these have yet tried languages that use extended character sets, e.g. Finnish, so that may reveal bugs.

1289. Supra, Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1990-02-03 20:31:24 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5586@blake.acs.washington.edu>
Source record: 243987

I thought i'd pass on my experience with Supra v3.37 and GCR.

Upon getting GCR about 2 weeks ago, i reformatted my Quantum 80S
with Supra 3.37. According to many sources, including Dave Small
and Supra themselves, Supra will allow you to create partitions
greater than 16 MB (i have TOS 1.0) as long as the larger partition(s)
are not used for GEMDOS. I proceeded with the following setup
under the Supra format utility:

C:\ 9
D:\ 9
E:\ 6
F:\ 15
G:\ 4.5
H:\ 10
I:\ 30 (30.19 = remainder)

I planned on using C-F for GEMDOS and G-I for Mac.
(I know these partition sizes/order may look strange, but the
were set like that for a reason.. obviously)

I watched Supra format the 164,000+ sectors totalling about 84MB.
0 bad sectors.. all looked fine.

I loaded up a few ST utilities.. including Spectre. Ran the
SPectre program to set defaults etc. When i came to the "format"
menu .... i noticed some strange things: Not only did Spectre
see the above 7 partitions, but there were partitions 8 and 9
of 12MB and 6MB resepectively. Partition 7 (I:\) still showed
30MB.. as a matter of fact, all the partitions were recognized
by Spectre and formatting the last 5 (including the "suprises")
worked flawlessly. I must have gone back into GEM desktop to
"show info" on my drives a zillion times.. the GEMDOS drives
added up correctly. Figuring i was not risking damaging anything...
i proceeded to install Spectre .. load in the Mac System file(s)
etc.. loaded up a few programs.. and so on.

The Mac OS saw all 5 partitions with sizes of 4.5,10,30,12 and 6
in that order. I was curious about the last partitions even
existing.. so i wrote to them .. ran programs off them...
i wrote to all five partitions.. in each case, the sizes
updated correctly.. as i put stuff in and took stuff out.

I somewhat suspected the 30 MB partition was not for real..
even though both Spectre and the Mac OS "saw" 30 MB in there.

For two weeks, i have used GCR with only a few crashes.. not nearly
as many as I get with GEM/TOS, ironically. Anyway, this morning,
i tried running Multi-finder.. well.. there were instant problems
recognizing drives and so on.. i didn't know if it was a function
of cache or system allocated memory or what..since i didn't know
much about multi-finder yet... in any event, i had to turn multi
finder off and work from finder. Since i don't have that much
mac stuff.. i created a bunch of folders in the 30MB partition
and copied programs and data into it....

Wouldn't you know it.. i couldn't put anymore than 12 MB inthe
partition.. even though the OS said there were 17MB or so left..

Well.. of course, by this time i realized that the partitons
were identical in size to the ones i had BEFORE i reformatted them
for Spectre/GCR.

Seems that the Supra format utility didn't do what it said it would
do... thinking back.. i definitely recall Supra prompting me
at the time of formatting that the 30MB partition could NOT be
used with GEMDOS... i clicked on "OK" or whatever..to say..
"go ahead". Either i "think" i clicked on there and didn't..
maybe i am at fault.. however, how does one explain Spectre's
"seeing" the 30MB... passing that info to the MAC OS and the
MAC OS updating the partiton etc...

Anyway.. this is the 6th time i have reformatted my drive..
not a fun thing to do... the result is that i continue
to "throw away" lots of ST software.... I figure today.. when
I reformat my drive, I'll make a small C:\ for a few startup
programs.. another larger partition for NOTATOR.. the
rest of my drive will be mac.

Any hints about the Supra format...? Do i have a bad version?
I remember going through hell when i first got the Supra
format utility that didn't like my Quantum... even though
it recognized the controller.... Is this another Supra
surprise? or another case of USER IDIOCY.. which i admit
i am rather successful at....

Thanks for the insights

-kevin
ramsiri@blake.acs.washington.edu

BTW: i have written to David Small about this a couple of times,
but he's been too busy to respond... so anyone out there
who can tell me what i am doing wrong will be much
appreciated.

1290. Spectre GCR--SoundMaster questions--Hard Drive questions

Newsgroup: comp.sys.atari.st
Date: 1990-02-03 20:55:41 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900203.14554087.021491@SFA.CP6>
Source record: 243976

Hello Spectre GCRers,

I've some questions egarding SoundMaster and hard drive backup. First SoundMaster:

Since the ST runs faster than a Mac Plus, sounds are slightly off, a bit squeaky. The quest is to make the sounds play at the correct speed. Using a program named SoundMover 1.51r, which works with SND files, sound speed can be changed by small increments rather than the larger block increments.
To get SoundMaster files to SND file formats, use a program named SOUND->SND 1.2E It will pull the sounds out. Another conversion is also necessary, the sounds have to changed to a ResEdit type format (yeah, I know, but Rome wasn't built in a day...). This is easy with DiskTop. Change the TYPE and CREATOR to lower cased 'rsrc'.
Now click on SoundMover 1.51r. Close the sounds that are showing up in the left file list. Open up the file that you've been working with. You can now work with it and change its speed.
After saving your work, use Sound Leech to convert the file to a SoundMaster file.
It is here that something is missing in the process. SoundMaster converts the sound back to its squeaky format, in spite of its changed speed. I'm convinced that there is some pilot error here.
If anyone is willing to correct my steps and tell me what I'm doing wrong, let me know. I'll summarize so other ST Spectre GCRers can profit.

My final question is in regard to hard drive backups. Is there a program similar to Turtle for the Mac that will work with Spectre GCR? Although Dave's Mega-Minute hard drive image backup utility indeed works, I get a little spooked when I encounter a read error during restore. It would be nice to be able to back up individual files automatically. Don't really need to be a speed freak for dependable backups. Hard drive backups is the only thing missing on Dave's incredibly marvelous GCR. (can't wait for 2.5!!!)
Many thanks for everyone's help!!!

From: boyd@fsucs.cs.fsu.edu
Message-ID: <9002040453.AA12498@fsucs.cs.fsu.edu>
Source record: 243978

I have had the following happen to me, and am unable to explain or correct it. Anyone having a solution or an explination please post to this newsgroup, or reply to me directly.

The scenario:

1. I formatted a 3.5" floppy in Double Density mode on an 386 equiped with High Density drives (I used format b: /t:80 /n:9)
2. I then put some files on it, with the PC (not an st).
3. Took it home to my trusty ST, ready to blast through some editing with Tempus 2. Files read fine from the disk, in and out of subdirectories.
4. Take back my now edited and improved files, and shove the disk back into the 386.
5. 386 gives me no volume name (there was one), and no files.

After some experimentation, I have found that if I modify a disk in any way (with the ST), the contents will be gone as far as the 386 is concerned. I am most miffed.

Source record: 243983

Can someone tell me how to deal with the GEM metafile which Uniterm produces when one hits Alt-F3? One gets a file which contains the picture on the graphics screen, but with much better resolution than the Atari screen (I think something like 4000 pixels horizontal times 3000 vertical, quite appropriate for the laser printer).

I tried to print it on the SLM804 with OUTPUT.PRG and the Diablo emulator. I got two identical-looking pages, each showing the picture, with the expected good resolution, but rather faint. Why do I get two pages?

When I try to print directly from Uniterm by selecting 'Printer' rather than 'Metafile' after hitting Alt-F3, I get an alert box telling me 'Unable to open VDI device'.

What I would really like however is to load the metafile into a graphics program to be able to modify it before printing (without loss of resolution of course). I tried two, Gemdraw and Arabesque. Both seem to have difficulties with the range of coordinates. It looks as if the high-order bits are just chopped off, so that several parts of the picture are folded on top of each other.

I would appreciate to hear from people who have succesfully done this kind of thing. Do I just have outdated versions of GDOS, OUTPUT and/or GEMDRAW? Uniterm and Arabesque are rather up-to-date though. Is there anything particular in ASSIGN.SYS one has to pay attention to? Can someone recommend a graphics program which can deal with this?

Sorry if this has come up before, I haven't followed this news group in recent months.

Thanks,
Klaus.

Well... there is a commercial product called DiskFit that I hear is really
good. I don't have it, nor have I ever used it (there was supposed to be a
shareware version of it, but its origins were flaky so I deleted it Just In
Case). I've been scanning (sorta) the Mac anonymous ftp sites, and have found
a few pd/shareware backup programs, but none seem to fit the bill (they either
take 2 hours for 20 megabytes (YUCK!) or don't quite know how to get the total
files on disk.. maybe they don't like HFS, I dunno).

1298. The 'PHANTOM TYPIST'

Newsgroup: comp.sys.atari.st
Date: 1990-02-04 16:48:43 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900204.10484196.021631@SFA.CP6>
Source record: 243990

There has been an increasing amount of talk about the 'phantom typist' on the ST, in which the computer appears to slow down and whatever characters are stored in the keyboard buffer, appear, albeit slowly. Some programs which have keyboard commands, such as WordPerfect can have work saved when you see this happen by pressing the save file command, typically <S>. It may occur a minute later (!!!! grrr) but it will occur.

This was reported on GEnie back in 1987, denied by Neil Harris and questioned by John Towns. Well, no doubt, the phantom typist is so incredibly difficult to duplicate. I was able to get it to appear regularly in Flash only to find that WordPerfect and WordWriter could do it also after I bought those packages.

Ok, this is an old bug or design flaw. Denial of it won't make it go away. Neither will bashing Atari or Atari's engineers. What is needed is for everyone who encounters it to immediately (!!!) write down what was done to cause the phantom to show and post what happened. Isolation is the problem on this phantom, not scapegoating.

Several reports might allow Ken, John, or Allen to zero in better on the theory of how the Phantom Typist shows.

I've two areas of question about the subject. The first one is the ST keyboard itself. Certain keyboard combinations will trigger a function key. Very obnoxious especially when it is 3:00 am and one begins fat-fingering keys. YAWN

The second one is with Spectre GCR. I have had (twice, but in a year time frame) the Phantom Typist to show in Spectre GCR. Behavior is identical to his showing up in the ST, i.e., characters stored in the keyboard buffer appear very slowly, including keyboard commands.

Hope this helps (???!!!)

I also have ICD CLEANUP for my BBS hard drives, and it is VERY nice.
It does everything automatically. All you really need to do is stand
there and click on CONTINUE.

However, it DOES require the ICD Host Adapter, and it DOES cost $29.95
(from ICD). However, it's worth it. The last thing I want to deal with
are bad sectors on a BBS HD.

The program does let you get into the nitty-gritty (if you wish). It's
reconfigurable and gives you quite a few options.

>seen direct replacements for sale in magazines.

Some drive mechs won't work on the ST. I do know that there is one
Sony drive that won't. I believe Jameco sells them for $59 or so.

Depending on what mech you had in the drive before, it could be easy or
hard. When I did the replacement on my old 354, it was a plug-n-play
affair. Recently, I did another replacement on a friend's 354, and it
was a nightmare. I guess Atari used different interface boards (those
boards that have the Atari connectors on them) for different mechs.

If you could tell us what mechs you have in those drives, it would be
easier to diagnose the problem. One simple thing you might check is the
drive ID jumper on the mech itself. Make sure it is on D0. You might
also have to play with the other jumpers to get it working correctly.

1304. Some Atari dealers in Canada

Newsgroup: comp.sys.atari.st
Date: 1990-02-04 19:56:43 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <25CC88FC.14033@maccs.dcss.mcmaster.ca>
Source record: 243855

Someone asked for a list of Atari dealers in Canada. I've been to Toronto shopping for ST supplies, but I hated the traffic, and besides that, we have 2 great dealers right here in Hamilton:

Advantage Computers
247 Centennial Parkway North; Unit 11
Hamilton, Ont.
L8E 2X3
(416) 578 - 6966 store
(416) 578 - 7764 fax

JMG CompuShoppe
Harvard Square
801 Mohawk Rd West
Hamilton, Ont.
{ don't know postal code, sorry }
(416) 575 - 3200

JMG has some great specials, and I'm looking forward to their March sale. For some even better deals, come to the TAF show on April 1, 1990. In TO. Lotsa people and some great deals. I don't know the exact location or time, but a few other people should.

If you're ever in the area, drop me a line, I'd be happy to show people where the stores are.

What with free trade and all, I think it is quite legal to bring computers and equipment across the border duty free. But don't quote me on that.

We have PC-Speed installed in a 1040ST. I don't know where you heard
that it doesn't support Hercules monochrome. That's what we use with
it. It does an excellent job.

We use monochrome probably 99% of the time as well, except for a few
games perhaps, and some graphics work.

We've been very happy with PC-Speed.

1306. Testing that programs conform to TOS rules

Newsgroup: comp.sys.atari.st
Date: 1990-02-04 20:56:38 UTC
From: knop@duteca
Message-ID: <721@duteca.UUCP>
Source record: 243854

I am getting bored of all those arguments against improving TOS,
because it involves changing non-documented features/bugs of TOS.

What we need is a means to test that an application does not use facts
about TOS that it should not rely on. With such a beast it is possible
that:
- programmers verify that they have programmed according to the rules.
- project managers verify that their programmers have programmed
according to the rules.
- buyers/users/owners of programs verify that programs are likely to
survive TOS upgrades.
- eventually, Atari creates a better TOS, because it is ensured that
the majority of application programs for their computers will
continue to work.
I believe that it is possible to create such a test suite.

What I am thinking of is a terminate-and-stay-resident program that
intercepts most (if not all) trap vectors. The test suite will make
sure that, in addition to really executing the requested trap:
- Successive mallocs NEVER return adjacent memory areas.
- The area just outside a malloc-ed area is not used by an application
program. (This can be done by regularly checking that the contents of
such memory areas have not been altered.)
- All registers that are not guaranteed to be preserved during a trap
are scrambled before return from that trap.
- All undocumented information in low memory (which is private to TOS)
is not there during normal program execution, but it is temporarily
restored DURING an intercepted trap.

In some of these cases this TSR program will be able to detect a
misbehaving application program as soon as it misbehaves, in other
cases the application program probably crashes the system shortly after
misbehaving.

There are probably many other undocumented properties of TOS that
might not be present in some future version. In general, the test suite
should make sure that undocumented properties will not work. The list
is only a start, there must be many more things that Atari can break
BECAUSE they are not documented.

Of course, the test suite will slow down the operation of the computer
during testing, that is the price that must be paid during development
to ensure better portability across TOS versions.

I am hoping for a vivid discussion on this topic.
- Do you think such a test suite is feasable ?

- Would YOU like to write such a test suite ?
- Which undocumented features/bugs should be added to the list ?

1309. MWC resource.prg! Major bug found!

Newsgroup: comp.sys.atari.st
Date: 1990-02-04 22:32:43 UTC
From: harryk@bucsb.UUCP
Message-ID: <249@bucsb.UUCP>
Source record: 243856

Hi world!

I'd like to report a major bug I found in the MWC's 'resource.prg' (you know it's the one that creates/modifies/edits resource files (.RSC)) I have the MWC compiler for over 6 months now, and among other things I was happy I could use a decent resource editor, like resource.prg. BUT, a month ago I purchased a 85 Mb seagate HD, along with the ICD faST HD kit, which I formatted to have 9 part itions. I'm working on a GEM application and until that time I was doing every-thing using disks and RAM-disk...naturally, I installed MWC in my new hard disk and everything was fine, until I tried to edit the resource file of my program!

Here it comes:

The 9 partitions I use are from C to K. When ruuning the 'resource.prg', it shows all the connected drives/partitions as icons on its OWN desktop. Well, icons A to H are ok, BUT the next icon, instead of having the letter I as its identifier, it has AGAIN the letter A .... icons J,K apear to be OK again. The trash-can icon is not OK at all..it is corrupted with just half of its drawings appearing in its interior and the name of the icon is not shown at all

If that was all, I wouldn't mind, but listen to this:

I tried to open the window for the partition I (which appears on the desktop as partition A) and i got an error alert saying something like: "you cannot access this device, check the connections" or something similar. OK, suppose I can live with it, and don't use partition I at all...but there is more.....

The resource file of my program is located in e:\mwc\src Lets try to load it so I can make the changes i want. I open the window for partition E and i'm get ting in the folder "mwc/src"...here is the file.. Now try to "Open" it..... ooppppsss......what's that?..an error message: "I cannot find .RSD file" what the %^%&$%*^*%%*% is it talking about? BOTH FILES ARE IN THERE(.RSC, .RSD) (.RSD is the corresponding .DFN file for RCS.PRG, or .DEF file for RCP.PRG) Let's ignore the error mesage, go on you stupid program.....whaaoo 3 bombs and back to the ST's desktop. AND now i have to reset my system...Shit!!!!

JESUS CHRIST, I can't even open the file...so the 'resource.prg' is useless

I tried to run it with no AUTO-programs and accessories present..same thing.
I tried to load some other .RSC files (for my previous project)...nothing.
I copied the program to drive A:, and ran it from there.....no luck.

I disabled the hd and ran it from drive a:\. Yes, it worked fine.....

Hmmm...maybe the ICD boot-utility is not compatible with the program. So, I made drive A:\ to be the booting drive, with the hard disk enabled. I tried again to run it from the hd..it didn't work, i tried from A:\..it didn't work.

Perhaps I should ask my friend Alex, who has a 65Mb Supra Drive. Well, it works fine with his system..but wait a sec....his hd has ONLY 6 partitions installed.

So I disabled partitions K,J,I and gave it another try! I cannot believe it!

IT WORKS FINE NOW....THE #@$%^&^%$#$ PROGRAM CANNOT WORK WITH MORE THAN SIX DEVICES INTALLED ON THE SYSTEM.

It sucks....I want all of my partitions, that's why i installed them

If anyone from Mark Williams read this article, I 'd like him to pass it to the guys who are reasponsible for this MAJOR BUG.

Being one of your customers and a person who uses his ST for programming mostly,I demand to get a fixed version of the 'resource.prg' file with no extra cost (or at least minimum-cost). It's a shame, such a good program to suffer from this kind of problems!

This article became too long. Sorry!

HARRY KARAYIANNIS
3rd year Computer Science
Boston University

PS: Of cource I will write MWC personally, to inform them about this bug; but I thought it was good for you to know about it too!

How many people could find ANY written material
either in the prerelease notes or in the manual
that says the new SOFTLINK runs on TOS 1.2 or higher?
Neither Digidesign nor Mikhail, C-lab's rep, ever
once suggested that my $30 plus phone calls etc
would amount to zip for the update.

Running SOFTLINK on TOS 1.0 yields:

ABORT TOS Unknown! Must be older than 1.2!

etc
etc
etc

Maybe i will keep my ST in GCR mac mode 100% of the time
instead of 90% from now on.

I know of one called LaserBrain, a German program. I believe some if not
all the versions are PD, but I could be wrong. I have no idea how you could
go about getting it, but perhaps you could try some PD disk vendors.

1316. Page flipping using the VBL interrupt.

Newsgroup: comp.sys.atari.st
Date: 1990-02-05 07:28:19 UTC
From: marc@cpsc.UCalgary.CA
Message-ID: <2480@cs-spool.calgary.UUCP>
Source record: 243995

I posted here almost a week ago asking if anyone could tell me how
to flip between two graphics screens using the VBL interrupt.

Well, I didn't get any replies telling me how to do it, although
many people asked if they could have my results when I was done :-)

(BTW, almost all of my reply mail bounced back with a "host unknown",
or something similar.. If you want to re-write me, by all means ...)

I got it working on my own, and now have a slight degree of gray
scaling for diplaying certain specific pictures (I use it to display
the fractals I generate on a NeXT computer up at the university
on my monochrome monitor at home, which is originally why I wanted
to do the page flipping in the first place. Fratals are more
interesting in "colour").

The only problem is this: The flicker is annoying. It's not really
extreme unless you start working with more than 3 shades, but STILL.
The flicker would probably go away if I was doing the page flipping
on a colour monitor, between two colour images (to generate a
possibility of 512 colours on a medium rez. screen at a time instead
of 16), but that's just an educated guess (I havn't tried it).
I say this because if two corresponding bit mapped "pixels" are
roughly the same colour, as you flip between them there shouldn't
be a big shock to the eye. Rather, if you flip between a white
"pixel" and a black "pixel" at 70 Hz (I think that's the value,
or is it 60?), then they eye CAN perceive the change.

Can anyone think of a way to get rid of the flicker for a monochrome
picture? Maybe using the HBL would have certain advantages.

Thanks,

1317. HELP! Floppy Drive not working out.

Newsgroup: comp.sys.atari.st
Date: 1990-02-05 08:11:04 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <34122@ucbvax.BERKELEY.EDU>
Source record: 243887

I'm having a big problem. I bought a 1.44Mb (high density) 3.5" floppy drive to replace the SS/DD drive I have now. My plan was to just pop the drive in and use it like an ordinary DS/DD drive, not a DS/HD drive. Well, it didn't work.

So far, all that happens is that the floppy acknowledges its existence. When I try to read, the light flashes on, but the computer cannot read the data on the diskette. When I formatted a diskette on it, the head did not move, and the end result was a diskette that claims to have 0 bytes used, 0 bytes free, and 0 everything else.

The drive is a Toshiba. That might have something to do with it; I recall seeing things about that drive before.

Hi,

the Turbo C Compiler version 2.0 should be available at the end of February
or begin of March (i think March or April !!!)

it costs ca. 500DM (TC2.0 & Source-Level-Debugger & new version of MAS) only
in a packet -- komplett version.
the update from version 1.1 & BUG & MAS up to 2.0 & ... costs ca. 200DM

so long -- Dieter

A few points:

I wouldn't bother trying to smuggle it into the US. Just declare it
and pay the duty. Better in the long run, especially if you eventually
want to depreciate it if you are earning money with it.
The Lynx I bought across the border only cost about 3 percent duty on the
unit and the games... the killer was the Federal Sales Tax at thirteen
percent (not that I intend to earn money! My kid probably will... can you
spell "hustler").

Re the non-USA availability of Atari stuff:
You got the Lynx, didn't you? Quit complaining :-)

I had to drive to Rochester in a snow storm to get mine (actually the
family gave me lots of encouragement to go... or else!)

From: squibby@eleazar.dartmouth.edu
Message-ID: <19140@dartvax.Dartmouth.EDU>
Source record: 243864

It struck me that NeXT's practice of including copious software and especially gnuware with their computer as adding enormous value to their product: It can function out of the box and one need not A)get a net connection nor B) try to find a NeXT dealer with software to have a perfectly functional computer with good software. When I got my original ST (I traded it in after th ASIC's died), The inclusion of 1st Word, Neochrome, BASIC and LOGO was a nice bonus and saved me from dealers more than I had to.

Considering the amount of net traffic devoted to finding reliable dealers, wouldn't it make sense for Atari to adopt a similar policy and secure rights to distribute the good Atari PD and shareware (FSF software, Sozobon, ARC, ZOO, Gulam, TeX, Uniterm...) with the computer. It would be a hit to their compiler set (Alcyon tools), but wouldn't it they make it up in computer sales? It might also be a convenient way to distribute that portion of documentation that is publicly available (gemdos.arc on terminator, progem articles, pexec cookbook...) and a listing of all registered commerical software for the ST. It would enlighten the community regarding the true potentials of the machine.

Just an Idea,
Clark Breyman

1326. Problems with HP and other MS-DOS formatted disks.

Newsgroup: comp.sys.atari.st
Date: 1990-02-05 15:37:02 UTC
From: ivan@cvax.psi.ch
Message-ID: <408*ivan@cvax.psi.ch>
Source record: 243865
Body handling: Inline uuencoded payload not displayed: NEWBPB.PRG

There have been several messages lately about weird results when using diskettes formatted on IBM-type machines (especially HPs). Basically, the ST seems to trash the directories/FATs. This *MAY* be the same problem I ran into last year transferring disks to & from an HP-150. There are two problems with this, neither of which HP is likely to have changed in later machines:

a) the HP-150 insists that the first three bytes in the bootsector be an Intel JMP SHORT <displacement>/NOP, where the value of displacement is critical (can't remember the value off-hand :-(, this despite the MS-DOS developer's guide suggesting that any value of displacement is OK, as well as the 3-byte JMP LONG <disp>, to validate an MS-DOS diskette.

b) the HP-150 also uses *TWO* reserved sectors, and has DOS loading data in the second sector, after the boot sector. The Atari TOS (up until the Megas; I can't check 1.4 as I don't believe Atari Schweiz has released it yet -- I'm still waiting for a Blitter!) *ASSUMES* only one reserved sector, so when it reads a HP-150 diskette it gets the FAT, directory, and data sectors all off by one. I guess you can see the problems that can occur if the two machines don't agree on the location of all these items...

The first problem is readily fixed with a format programme or sector editor; just use DEBUG to read in the boot sector of a disk formatted on the DOS machine (L0 n 0 1 where n=0 for A:, etc) and dump out the first bit (D0) -- note the first three bytes (probably EB xx 90) and, following a hint on the net last week, also the Media Descriptor Byte at location 015h. Make sure that your Atari disk has the same values here and you may be able to read it on the DOS machine. While you have the dump in front of you, also check bytes at 01eh and 01fh; these give the number of reserved sectors. If it's anything other than 01 00 (e.g. 02 00 on the HP) then TOS is guaranteed to trash or misread disks formatted on the DOS machine. I wrote a patch that enabled me to intercept BPB calls and correct the information returned to the caller in these cases. It's short, so the docs and UUE file follow. Because of its ancestry I won't post the sources -- they're available on request.
ivan

---------- Coupez ici! 8< ----------

NEWBPB.PRG
==========

A programme to allow the Atari ST to read properly diskettes
with more than one reserved sector.

PROBLEM
======= The Atari ST, at least up until the Mega ST versions (I haven't been

able to check TOS1.4 or the STe TOS), had a bug where it assumed that all floppies had only one reserved sector -- the boot sector. This bug occurs in the routine to return the BPB (Bios Parameter Block) for the diskettes. This causes problems when trying to read, for example, disks from a HP-150 MS-DOS machine, which has two reserved sectors, since the calculated locations for the rest of the disk (FAT sectors, root directory, and so on) are wrong.

SOLUTION
======== I have written a little programme, based on ideas from a couple of programmes from Landon Dyer of Atari Corp., a RAM-disk written by Volker Brandt, and a virus I dissected in September 1989, which intercepts the BPB routine and recalculates the FAT, directory, and data locations from boot-sector information which is left in memory after the BPB routine is called. This apparently works because of the way the rest of TOS interprets the BPB data; in particular, it obviously requires that the two FAT copies are contiguous, and calculates the start of the first by subtracting the FAT length from the position of the second.

TO USE
====== The programme NEWBPB.PRG should be run before you try to access diskettes with more than one reserved sector. This can be accomplished by double-clicking on it from the desktop. If your need to read these disks is more than casual, you may want to put the programme in the AUTO folder of your boot-disk so that it is automatically executed as you boot. It only needs to be run once as it stays resident until the machine is powered down, but it shouldn't do any harm if it is executed again (just waste time and memory-space).

DISCLAIMER
========== This appears to work on the one HP-150-formatted diskette I have. Tha's a 100% success rate, but your mileage may vary! As with any programme of this nature, you should test it carefully (write-protect disks, etc.) before trusting it. If there's any problem, please let me know and I'll try to fix it, but I make no warranty as to the fitness of this programme for any purposes and disclaim any responsibility for any harm resulting from the use of the programme.

Does anybody know how similar the ST and PC versions of the compiler
are ? The reason I ask is that I have Turbo C v1.5 for the PC and if the
two versions were similar I might be able to make do with the PC manual
for all the UN*X-like stuff and only be forced onto the German manual for
the GEM/ST specific stuff.

I would naturally prefer an English version on Turbo C but might be
left waiting for a long time.

Any information would be appreciated,

Padraig.

1328. Questions about TeX

Newsgroup: comp.sys.atari.st

From: hagelin@lne.kth.se
Message-ID: <38.25cdb349@lne.kth.se>
Source record: 243868

Questions about TeX for the ST.

I have seen that TeX is sometimes mentioned in this newsgroup. Does TeX really exist for the Atari ST ? How much memory does it use, do I have to have a laserprinter, is it fully compatible with TeX on BIG computers, can I transfer a DVI-file from the Atari to another computer and still wind up with a beautifully TeX:ed text ? Where can I find TeX and is it public domain ?

I would appriciate an answer to these quesTeXions and anything else that is worth knowing about this subject...

Thanks in advance
Martin

> If democracy means Coke, Pepsi, Apple Pie and Apple Corp, I vote Communist.

Jan, the USA market is being relegated to Third World Status by the marketing of Atari Corp. There is no other explanation for Atari Corp selling new products in Europe first. As far as the USA market being so much smaller than the Europoen market, that is the fault of Atari Corp. If Atari Corp were to aggresively market the Atari ST/TT computers here in the USA, than the USA market would be bigger then the Europeon market.

Atari Corp made a committment in 1989 to market new products here in the USA first. But you can see just how much an Atari promise is worth. Heck, we still can't get STes, or the Atari PC line. Maybe though Atari Corp is just an indication of the overall decline of the entire USA. More and more hi tech is being developed in The Far East and Europe and USA is losing ground every day. Just look at high definition television. The Japanese are leading the USA in that area.

The is NO REASON for Atari STs to be so poorly marketed here in the USA. With a better marketing and distribution system, the USA could easily lead Europe in sales of Atari products! The Atari has many advantages over Macs and Amigas. but, here is the USA, marketing is King Kong. Without good marketing, your product is dead. And Atari Corp has never had decent marketing and dsitribution here in the USA.

Heck, I just started learning to use PageStream 1.8 this weekend. And PgS 1.8 is every bit as good as any Mac program, and costs 1/3 the price of some of the Mac DTPs. So, Sts could be easily sold as DTP systems. I find that there is very little work that I have to do on my Spectre 128 that I can't do on my ST4.

1331. Re: The 'PHANTOM TYPIST'

Newsgroup: comp.sys.atari.st
Date: 1990-02-05 17:13:58 UTC
From: alex@athertn.Atherton.COM
Message-ID: <17814@laurel.athertn.Atherton.COM>
Source record: 243870

Regarding the phantom typist and hunting it down...

The TSR Newbell.prg (which replaces the bell on the Atari with digitized sound playback) seems to make this bug happen fairly frequently; all you need to do is pop up the 'About GEM' dialog box from the desktop, click on anywhere _but_ the OK button, and wait for the sound to stop playing. About 1 in 4 times, you'll get multiple playbacks of the sound, followed by a whole series of keyclicks (the phantom typist!). As soon as you press a key, the typing stops.

Since Newbell uses the timer A vector, might something be going on there?

From: alex@athertn.Atherton.COM
Message-ID: <17815@laurel.athertn.Atherton.COM>
Source record: 243871

Chris Lilley writes about the 'Bong!' in MicroEmacs 3.10.

You haven't configured it correctly. I had this going for a while too, and it was annoying as you know what. Then I read the manual. MicroEmacs 3.10, unlike earlier versions, is a _GEM_ program, so if you're running it from a CLI, you have to do something like:

"GEM .../path/emacs.prg <file>"

in order to run it correctly. If I recall, you also have to INSTALL it as a GEM application from the desktop. Can't recall right off the top of my head, though. Read the docs (yeah, I realize that they're huge.), it's mentioned in there somewhere. BTW, MicroEmacs 3.10 is _great_! (Supports the mouse and a whole bunch of other stuff.)

Well, here's my two cents worth. First of all, I have worked for one of the nation's largest ST dealers for about 9 months now, so I have a little perspective on the issue. One of the major reasons that equipment seems to get overseas faster than it arrives here is a little organization called the FCC. Not only is the process for approval slow, it gives any company an excuse for not releasing products on time.

I agree entirely that shipping overseas is a good idea, but I think that Atari has taken it a little too far. In their attempts to expand their overseas market, Atari has forgotten about the US market completely. Not only is Atari at fault in this category, many of the third party software developers are guilty as well. Ever seen an American version of Turbo C/Pascal from Borland?

I also don't feel that delays in the introduction of products to the US market are due to marketing. Atari does little (read almost nothing) in marketing in the US. It relies heavily on the major dealers to sell the product for them. This alone causes many problems, particularly when the dealers know as little about the products as the consumers. The dealers would probably be willing to pass on information to consumers if it were only available.

I too have had the problem of the Phantom Typest. I've has my ST for three years now, and this problem didn't show up until last month. I was running WordWriter St (From Timeworks) and at first I thought the keyboard locked up on me, but then everything I typed and commands I issued were delayed for about a minute. I was still able to save my work, but it took a long while. I wasn't doing anything different from my usual setup. I don't know why it would just start happening.

Please post any solutions or remedies.

Ok, grab the native. Grab your elephant gun. Place the business end of the
gun against the skull of the native. State "I need to know if this path
leads to safety and I'm gonna take you with me to find out." Finally, ask,
"Do you suggest the left path?"

I had a similiar problem on my Mega... The only difference was that
the characters were appearing <very> quickly in the keyboard buffer. The
fix was to open the keyboard and put some shielding between the boards in
there, apparently some leads were touching or something. I could also
(sometimes) fix it by unplugging the keyboard for a second and replugging it.
I'm not sure if this is the same problem that your encountering, but it may
be similiar...

>Those would be HDX 3.0. HDX 3.0 allows partitions up to 1 GBy (that's
>1024 MB in case you didn't know.), It also allows more partitions per
>physical drive.

Right. Actually it's 3.01; the driver that came with 3.0 had a bug,
though the formatter (HDX) is the same.

>>unreliable for long term use?

Certainly not.

>The only problem, however, is that many disk utility programs ...
>don't know how to handle the larger partitions.

Also right. Here's the bottom line: when you have a partition larger
than 16MB, the driver creates the partition with 1KB sectors (or more!)
rather than 512-byte sectors, which is the old value. Cluster size is
still two sectors, whatever size that is. The disk itself is formatted
with 512-byte sectors, and Rwabs does blocking and deblocking, turning
requests for "one logical sector" into as many physical sectors as
necessary.

The reason for the large-sector implementation is that all GEMDOSes can
handle any (power-of-two) sector size, but not all can handle a cluster
size other than two.

The drawback is that some (most) utilities assume that one sector is
always 512 bytes. They could have used the Getbpb() call and used the
sector size returned from that, but the original TOS documentation all
but guaranteed 512 bytes forever. These programs will crash, or worse,
will fail quietly because they read "one sector" into a buffer which is
only 512 bytes long; the Rwabs transfers 1K, clobbering whatever came
after the buffer in memory. Also, their notion of how big a sector is
(e.g. number of directory entry slots in a directory sector) will be
wrong.

As an additional complication, if you use the "raw mode" (also called
"physical device") bit in the first arg to Rwabs, you get physical
sectors, which are still 512 bytes. That number is not obtainable as a
variable anywhere, so it'll probably stay at 512.

The hardest-hit class of programs is the "add cache sectors" or other disk-caching kind, because it needs to know how big a buffer to allocate. The answer to that question is impossible to compute, so it's available from the hard-disk driver. (It's impossible to compute because it involves a user-preference value which can be patched into the driver: with removable media you could pop the cartridge and put in one with larger logical sectors, so the user tells the driver a minimum for the "maximum sector-size" value to use.)

CACHExxx.PRG from Atari, of course, interrogates the driver and uses that number correctly.

I'm not publishing the way to interrogate the driver here because I would not get it right. The straight scoop is avaiable to developers in the HDX 3.0 Release Notes document.

The moral is, utilities should always use Getbpb to find out how big sectors are, how many sectors per cluster, etc., and base all your other calculations and "constants" on the answers. If you're adding GEMDOS buffers or other permanent objects, get the release notes and do it right.

Message-ID: <251@bucsb.UUCP>
Source record: 243880

(Since my mail to Stephen Jacobs keeps bouncing, i reply through the net)

Steph, thanks a lot for your information...but what do you mean it's not stable? Do you refer to the comparison between ver 3.10 and ver 3.9 1/4,or you compare it with another implementation of EMACS for micros?
I just didn't understand whether you consider ver 3.9 1/4 to be stable or not IMHO ver 3.9 1/4 is good enough(i admit it's slow while reading or writing to the drive, but,perhaps it's due to the fact that it uses the UNIX-like function fwrite() and fread(), instead of the BIOS ones: Fwrite() and Fread()...I don't know for sure, though)
Anyway, it has some other neat features (like C-mode for .c and .h files, sup ports MWC's and Personal PAscal's enviroments + a lot more) and thus I can live with its slow drive-access. Does ver 3.10 support all of the features of ver 3.9 1/4?

I would like to thank you again, and if you have the time please reply this message too!

Take care!

From: drp9500@ultb.isc.rit.edu
Message-ID: <2112@ultb.isc.rit.edu>
Source record: 243882

I have this problem with the 5 1/4" drive I have hooked up to
mine....(also with the 3 1/2")

It appears that if the ST accesses the disk at all that the boot
sector gets either rewritten or corrupted in some way that the IBM (PC
Ditto) can't read.

I correect this by using DC Format and re writing an IBM boot sector
to the disk and it reads fine. (I have to do this more on the 3 1/2"
than the 5 1/4")

Sure is a pain in the ass fix but it works for now.....

Bob

****
NOTE: THIS IS NOT SENT BY ME, PLEASE REPLY TO ADDRESS AT END
****

Subject: SAMPLERS - the one that I want....

SAMPLERS: I have been trying to find a decent sampler at "the right price".
What I need is something a bit more professional then the likes of REPLAY
(8-bit, mono, minimal MIDI, designed for L-M Rez gaming types....), but not
quite up to ADAPI,II,AKAI-S900 spec.

In fact, what I could do with is (in order of importance):
At least 2 outputs (pref 4) and able to bung different sounds down each.
A good MIDI control - not just note on/off, pitch etc, but control too.
Support/upgrades etc.
12 bits (though 8 can still sound good, so not too important...)
Good Mono display.
Priced 200-300 quids. (Pounds Sterling to you across the pond....)

I have looked quite a bit, and no body seems to have a package to fit the bill.
I had hoped Germany would have something - Their stuff is generally 10-20 times
better then UK offerings, but my best chance seams to be the ProSampler by
Galaxy coming out in March (so they say...). G-Datas' AS sound sampler III is
16 bit MONO! no good for me.....

As for the Britsh offerings, Tony Racine at AVR has some good ideas, except
that he does not think the market exists for what I want. I put this down to
him not knowing about the recording industry. (Think: Most Studios have at
least one ST (for running Pro-24 etc) so a good sampler using a Mega as control
and memory would really sell. If the studios use them, bedroom studios like
mine will too to maintain compatability)

The biggest joke is POWER COMPUTING (I noticed that someone else on the net
seems to question this firm....). They "market" MOUSE MUSIC, which on paper
looks good (8 bits only, but Stereo, so more than one ouput), but talking to
various people (including Chris, the programmer) got me worried, there were
problems they said.... So I asked Power Computing for a Demo. The weeks passed,
Ken (of PC) kept saying it would be with me of friday/friday/friday etc. What
finally convinced me was when Chris left the company - after falling out with
the hardware designer! I would never now touch Power Computing with a
bargepole, a very very long one too!

So: If anyone out there knows of a Sampler that has multiple outs, please let
me know!!!

Thanks,

Fraser Stephens, UK.AC.KCL.CC.OAK::ZDEE050

1345. Sooner or later it _will_ happen to you.

Newsgroup: comp.sys.atari.st

From: alex@athertn.Atherton.COM
Message-ID: <17829@laurel.athertn.Atherton.COM>
Source record: 243886

Over the weekend I managed to completely blow away my hard drive. It wouldn't boot, it wouldn't talk to my ST at all, even when I ran AHDI from floppy.

Wouldn't do _nuthin'_.

~60 meg, gone, all gone.

Would you beleive that this has a happy ending? I had just made backups 2 days earlier, and hadn't done anything since. (Well, I'd done a little, but it was easily recoverable). I didn't lose anything except the 4 hours it took me to reformat and restore my harddrive.

Moral:
It can happen to you.
It will happen to you.
Unless you have good backups, you are scr*wed.
Unless you have an easy way to make them, you won't have good backups.
Get a good backup system, _now_.

The buns you save may be your own.

1350. Error in TOS file browser?

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 03:19:12 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Feb5.224924est.58370@ugw.utcs.utoronto.ca>
Source record: 243893

When I double click on certain types of files to browse through them, I find that paging forward (using the space bar) works fine. However, using the return key, by holding it down to cause the file to scroll, eventually causes an 11 bomb crash.
This seems not to be a problem on vanilla text files, but is a problem on text files with long lengths, possibly related to the carriage return character not being in the usual place.
This same 'bug' (if it is such) shows up when using ABZMON, and scrolling through a memory or file dump.
Has anyone else noticed this? Is it known to occur under certain circumstances?

Incidentally, I highly recommend ABZMON as a debugging device. It comes with source code and is PD. I can send it to one of the archives if the concensus is that it would be useful.

For what it's worth, I tried to respond and the message bounced from someplace nearer to you than to me.

Anyway, PageStream has simple drawing capabilities, and produces Postscript output. It may also handle HP LaserJet directly, I don't remember for sure.

Can compiler packages be used on these MSDOG emulators?
I was wonderin' 'bout Turbo C or the Zortech one.

Why not do a '386 'DMA box'? That way you COULD run UNIX & X Windows, no?

What can you REALLY do with the current products that are out?

Ed <wasn't there talk of an '386SX based emulator?> June

I was wondering if there was a program that would help to
clean up my hard disk; that is, somethig that would organize all the
fragmented files and what-not and place all the unused space in a
large continuous section on the drive. You know what I mean, don't
you? :-)

Brett L Maraldo

We recently received 2 Atari 800XL and 1 1200XL computers with disk drives and a printer. Of course we are very grateful. But in order to use the computers with the kids we work with we need software. At this point, we'll take anything...beggars aren't choosers. Unfortunately we aren't budgeted for buying software, but I'm **very** interested in exposing these kids to computers; I think they'll love them. Our agency treats chemically dependent teenagers in Appalachian East Tennessee. (Need educational, recreational, productivity software; disk or cartridge.)

Source record: 243846

Hello, world!

I've read some messages descibing the new desktop named
GEMINI and I realized, that now's the time to mail some
words of explanation.

One and a half year ago a friend of mine and I started to
develop a new desktop for the Atari ST. The actual version
offers the following features:
- Icons on the desktop background (folders and files)
- faster windows with two icon sizes and any monospaced
GDOS fonts in text mode
- correlation between files and icons, files and applications
via UNIX-Wildcards
- builtin UNIX-like shell, which runs in a GEM-window (using
any monospaced font you like)
- TOS programs are running inside this window
- any program can be started as 'overlay', which means that
Gemini is completely removed from memory and only a small
manager (20 KB) is running.
- key-scrolling in file windows (you press 'm' and the window
tries to display as many filenames starting with 'm' as
possible)
- if you drag a file on a program icon, Gemini starts the program
giving the filename as parameter
- draggable dialog boxes (flying dialogs) with shortcuts for every
entry (of course there are menu shortcuts, too)
- many other features I got so used to that I can't think of them
no more

How to get Gemini:
Four months ago we started to distribute the german version as
shareware and I heard that someone had posted it to usenet.
In the version 1.0 of the program all the texts were written
in english (but not the doc files), but the current version 1.1
is completely in german. Don't panic, you don't need to buy a
german dictionary! We'll make an english and german version REAL
SOON NOW and will post them to usenet. (Watch out for us!)

Gemini is a shareware program. The shareware price in Germany is
50,- DM (Deutschmark) and we're still thinking of a way to get this
over the ocean. If You have any good idea or any experiences, please
tell us!

thats all for now, cu :-)

To: info-atari16

Subject: external drive

I am attempting to connect a home-brew external disk drive to my 1040
with little success.

Parts used. Case with power supply.
Floppy cable bought from Best Electronics.
NEC FD1037A 3.5 floppy drive.

I am 99% certain I have the wires properly connected as listed below

1040 Drive
1 -- 30
2 -- 32
3 -- 3
4 -- 8
5 -- 10
6 not connected
7 -- 7
8 -- 16
9 - 18
10 -- 20
11 -- 22
12 -- 24
13 -- 26
14 -- 28

I stepped the ribbon cable to a db37 to make it look custom and
verified the wire placement with an ohm meter to make sure every-
thing matched.

The NEC has a four position dip next to its' 34 pin out and I have tried
it in all four positions and found no improvement.

When I power up with the external connected and turned on, only the
A drive responds and it does not recognize any data on the disk
(a window opens as A with 0 files. This disk has files on it).
If try to open drive B it asks for a disk for drive A as drive B. It
stills refuses to recognize any data. If I disconnect the external drive,
A responds properly.

I am missing something? I do not know if I need some more parts in the
loop or if I just have something wired improperly.

HELP!!!

Please respond to me directly, I don't get the digest. Thanks!

Norm Frech (frech@MWRAAA.ARMY.MIL)

1360. SLM804 & TeX

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 08:14:08 UTC
From: XUUM23@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGGHCZZBBNZV.at.UMPA>
Source record: 243803

Does anyone have experience using the SLM804 with TeX/LaTeX. I
have got TeX up and running and use the excellent program DVI2SLM
to output the results. The output however is not very good. Now as
I understand it the SLM is a 300dpi laser printer same as the HP
laser, Apple laser etc. Can someone tell me what I'm doing wrong
as the output I get at the standard 10pt size is -please excuse- very
thin. By that I mean eg. in cmr10 the lower sweep of the 'e' character
actually breaks into seperate dots. Someone at this site suggested
using METAFONT. I did get it working but I have no idea of the
setting for the SLM. Can someone i) send me the '.MF' file for the
SLM804 (this has to be mainly for interest as it takes a long....time
to make even CMR10) and ii) direct me to a place where I might get
the fonts - I can do mail but I'm not sure if I can FTP anywhere not
in the UK.
As I only get to read the list intermittently could you mail me and
I'll make up a summary and post it to the list.
Many thanks in advance

Steve C.

1361. Gemini doc's

I just installed the Gemini desktop and I am really enjoying it. I managed to figure out how to set it up and create the shell init file, etc. but I need to know more. Does anyone know of/have a translation of the German documentation? I also need the translation so that I can figure out where to send the shareware payment and how much to send in US dollars. I would be willing to post the distribution arc file I got off GEnie, but it would be better with English docs, for us English speaking folks that is. Helpful hints welcome!

From: dsmall@well.UUCP
Message-ID: <15992@well.UUCP>
Source record: 243804

[The basenote asks questions about SoundMaster with Spectre GCR].

You'll be pleased to hear that version 2.5 (it may be 2.6 shortly)
is just passing final beta test. In it, 60 hz vblank is supported, so both
benchmark programs that use VBL, and more importantly, SOUND, which is
intrinsically tied to VBL, are dead on. No more high pitched sounds; no more
need to convert resources to get the pitch straight. Doug Wheeler did the
coding for this, and many other 2.5 fixes.

With any luck, 2.5 will be out in less than a month. Gotta finish
off the newsletter, get disks duped, start mailing. Free to 2.3K owners.

As for HD Backup, the only name I've heard is DiskFit. Many do not
work because we don't use Apple's SCSI dispatcher... which would be, err,
entertaining.

-- thanks, Dave / Gadgets

1363. Re: Supra, Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 09:07:42 UTC
From: dsmall@well.UUCP
Message-ID: <15993@well.UUCP>
Source record: 243805

[The basenote lists some bizarre problems encountered with a Quantum 80-s drive, which apparently fooled Spectre into thinking it was 105 mb long.]

Kevin, I'm sorry I missed you via Email; I can't get to the WELL as often as I'd like, as we're putting the final touches onto 2.5 (very time intensive).

I think you'll find that what happened is Supra's software left glop in the trailing ends of the partition sector. GEM ignored it. However, the Spectre utilities saw the glop, and somehow interpreted it as reasonable partition data. I really have no idea how it got there; perhaps a previous user had formatted the drive as a 100 meg unit, and gotten far enough to stamp out a partition sector? I'm puzzled.

Anyway, I'm glad in a way that the problem is resolved, and you've found the top possible sector # on your drive. Another way to find this is just to run PARTCOPY with a long sector count, from the drive to itself, until it reports a failure.

Naturally, there's always the possibility the Spectre software screwed up; however, I recall *many* times seeing trash in the "bottom" of the Supra partition table. I usually go zero it out by hand when I find it. I'll bet that's what happened to you.

-- thanks, Dave / Gadgets

1364. How to make newsletter available

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 09:21:09 UTC
From: dsmall@well.UUCP
Message-ID: <15994@well.UUCP>
Source record: 243806

Okay, those who know more about the 'net and UUCP and FTP than I.
(This should narrow the field by approximately 1%).

We're putting the finishing touches on the next Gadgets
newsletter, and I'd like to make it available online here in some
fashion. It's way too long to just post, unless I broke it into
32K pieces (I believe 32K is the UUCP limit; I've run into it
elsewhere moving files Well <-> Gadgets machine), and look, by far
not everyone here has a Spectre unit nor cares, *and*, it goes
against my grain to more-or-less advertise this way.

Still, I'd like some easy way for net users to be able to
download the newsletter from somewhere.

FTP: I know nothing about FTP. I have no man page for FTP,
no FTP on either my 7300 or the more generic UNIX machine. If someone
is willing to act as an FTP site for the newsletter, and for Doug
Wheeler's much improved GCR disk tester, for downloading, I'd be happy
to send them along, however is needed. Email me here
(dsmall@well.sf.ca.us) if interested.

UUCP: I suppose I could set up my 7300 for UUCP'ing the stuff
across; that'd mean a call for you.

EMAIL: I could probably break the newsletter into <32K segments
and email it upon requests, but this would get old pretty fast, as
you can imagine. Also, I've had bad luck with email bouncing back to me.
I'd really prefer not to do this unless there's no other way.

So, if you would, please educate me on how I can make this available
to you with minimum hassles to us both, and without having to publicly post
it; same goes for Doug's GCR Tester program.

Finally, Doug has also written a truly excellent pageprinter program
for the SLM-804. It outputs your text in form suitable for 8 1/2 x 11 3-ring
binding, double sided, with easy directions to do the double siding. The
result is 4 pages of text reduced on to 1 physical page doublesided, set up
to easily "flip", so facing pages keep continuity. It's currently shareware
on GEnie and is just excellent; if nothing else, it saves a heck of a lot
of paper. Check it out -- it's really nice.

It's no problem for me to post the newsletter to CIS or GEnie; I know
enough to fumble by there (and fumble I do). Here, I don't have the knowledge
to make a good fumble of it even.

If you could email instead of replying here, it'd waste less bandwidth..

-- thanks, Dave / Gadgets by Small

p.s. Would anyone care for a *brief* 2.5 features list as a post? Would that be an acceptable compromise?

1366. Genie <-> Usenet 2-way trial

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 09:57:59 UTC
From: dsmall@well.UUCP
Message-ID: <15995@well.UUCP>
Source record: 243808

Okay --
I don't want to generate any controversy re: the GEnie uplink thing,
which was admittedly not handled well last time around.

It looks like there's an okay on the GEnie end for a gateway to
GEnie with the following:

1) 2-way note throughput. (see below for more).
2) email
3) *No* copyright hassles (see below)

The last such uplink, as you'll recall, was 1-way, no email, and while
GEnie was accused of copyright hassles, it really wasn't that way.

Okay, on #1:

2-way notes. Yes, this can be done. However, there will need to be
experimentation done, because GEnie's notes paradigm is different than
USENET. Also, GEnie users will require some training in the customs of USENET;
for instance, quoting from previous notes when making comments,
signature lines -- all the stuff you really only learn by *reading notes*,
and by reading the ever-helpful How To Be On USENET materials that come with
the news package.

We have one or two dim flickers of ideas for how to resolve the notes
paradigm problem (suggestions are welcome).

We also want to make certain we do not flood USENET with low-signal
high-noise notes. Hence, we won't be hooking straight to the Atari ST RT
on GEnie, where the note volume would overwhelm USENET. Instead, it would be
to an experimental, controlled, limited-access area, where people who don't
understand USENET customs & protocol don't get their notes posted here.
(Probably at the start, the best way, especially for testing purposes, would
be to grant access to people who are already on USENET on the GEnie end.)

On the GEnie end, notes are concentrated by broad subjects
("TT", "Hard Disks", etc) into "topics", rather than by individual header;
otherwise, we'd end up overwhelming the GEnie system software by starting
too many 1-3 reply topics.

Again, suggestions are welcome.

#2: Email. My mailer is not bright enough to handle nearly anything.
This will have to be put off for a bit until I get a better one running.
I mean, it would be nice if Internet addresses worked.. :-)

#3: Copyright hassles. Much was made of little in the anthology
copyright. I talked with GEnie about it. Their only concern is that local

BBS's don't mass-download GEnie notes, lifted directly from GEnie, with their "value added". However, they know enough about USENET to know that the news software, by its very nature, makes *every* news site form the same "compilation" of notes in the /usr/spool/news/comp/sys/atari/st subdirectory -- so there's little point to GEnie claiming any copyright. I realize there are people out there that distrust GEnie or anything corporate, so I can probably get a formal statement saying yes, we'll blow off the copyright for USENET stuff.

What I propose is a TRIAL PERIOD of 30 days for a 2-way link. If at the end of 30 days it didn't work, I'll say oh well, and go do something else. This is an experimental project anyway and may not work, and it may not be possible to really resolve the differences in note paradigm schemes between USENET and GEnie, on a practical, day to day level. In addition, it may not be possible for GEnie's editor as a practical matter to do things like quote from a previous article and so forth.

As usual, I'll filter anyone who asks out of the feed, including those who've already asked.

The approved method seems to be a vote; would you please send me your thoughts at dsmall@well.sf.ca.us, or well!dsmall, or however the note got to you. If even a fair minority is opposed, I'll drop it. I'm proposing this only because many people were careful to say that their only real objection to the previous link was its 1-way nature.

There's no rush, by the way. We're busy with 2.5, getting the final version through beta test (sheesh, 832K is a bitch), writing newsletters, and the ever-popular packing & shipping tape.

Now, I'm asking *here*, where it'll happen, *before* asking in the news.* areas, which I'll go to *only* if you local people, who it'll affect, okay it. THIS IS JUST TO SEE IF I SHOULD PURSUE IT FARTHER. IT DOESN'T MEAN I'LL TURN IT ON TOMORROW; IT AIN'T EVEN WRITTEN!

I do think there is a substantial advantage in GEnie being able to access the more international group that USENET has, for both networks. ST activity in Germany is the envy on the US. Similarly, I get many questions (34 tonight) via email from users in Europe regarding Spectre, hard disks, and other things; I'm sure other U.S. companies would like to be able to communicate with their international users. And finally, while GEnie is looked down on by some, it's the home of some important stuff -- Jim Allen's discussion of the 6-chip TOS 1.4 EPROM hassle with SGS 373's, which anyone with a Mega and that TOS ought to know about; up to date discussions of PC-Ditto II, which have barely made it here (Bill's working on a software fix for the problems); the collapse of the large distributor CSS; T-16 accelerator support, and lots of other stuff. It seems to me that it never hurts to have access to *more* information; comp.sys.atari.st hardly overwhelms my ability to read it. (A working balance that doesn't drown USENET in GEnie notes is of course required; at first, I'll hand enforce it, and anyway the software will need testing. I'll try to avoid any bad postings by checking them out before allowing UUCICO to send them on their way.)

I realize that this was a very emotional topic a while ago. However,
it was made very clear to me that what people objected to was the 1-way link;
a 2-way link was frequently mentioned as "just fine", much as Portal and
The Well manage their "gateways" (although the Well is just "rn" to me.)

Anyway, what do you think? Would you mind a 30-day trial period
under those conditions above? If, after that, you don't think it belongs,
then it can go into the bit bucket as another one that didn't work.
I need to do some experimenting on how to link the paradigms effectively, but
I won't start until people say it's alright.

Anywho, I've cleaned out my mailbox, and will be checking back
periodically. If anyone really cares, someone else can tally votes, but look,
I'm not going to go to the effort of bringing up a link if it isn't wanted.

Thanks for your time; long note, huh?

-- Dave Small / Gadgets by Small, Inc.
?

p.s. I'd appreciate it if we could go easy on discussing this publicly
until there's been a bit of time for it to propogate and for email to
come in. If there's a negative response, there's no point in discussing it
anyway, is there?

I am hoping to try and hook up an ibm compatable 1.44 meg 3.5 or an
ibm 720k 3.5 floppy to my 1040ST. I would like to hook it to the internal
drive connections, or possibly to the external drive port. Does anyone
have the pin outs for the ibm drive and/or the internal st drive, if
different. Any hints or suggestions would be appreiciated...
Thanks,
Brian

If you are a fan of the game warship, I now have a copy of a program to print out a human readable form of the save game file. If you want to know what use this program has, it does not have much. You can optain most of the information that it gives you by saving the game, restarting in two player mode, and using the game itself to tell you all the information about both sides. However, if you want to understand some of the bugs in the game, it provides useful information.

Warship is a fine game inspite of little bugs. The bugs don't make the game crash, they just play a little lose with the laws of physics. Some of them probably result from the original version be crammed into an 8 bit machine.

> of 12MB and 6MB respectively. Partition 7 (I:\) still showed

Here are some "gotchas".

First, as far a SUPRA and Spectre are concerned, there are 12 partitions
on a disk. All of the information is kept in sector 0. It sounds as
if you have corruption in some of the areas.
Use suputl.prg to set to 0 the partitions that done exist.
I have noticed that some garbage values prevent suputl from doing this.
Then use supedit.prg to (CAREFULLY) set the partitions to 0.

Second. there are two kinds of disk drives. SCSI drives take care of
defective areas automatically. All other drives require that the formatter
handle the problem. Most (all?) SUPRA controllers contain an Adaptec
4000 (MFM) or 4070 (RLL) controller.
Adaptec controllers EXPECT to be told the defect list for the disk.
Adaptec then makes these sectors disappear; they are not numbered or accessable.
===== What follows is My Opinion, not SUPRA's =====
Supra's formatter, hdx, does not support this mode in the Adaptec.
Instead, SUPRA (and ICD and ATARI) format all sectors, then try to map the
bad ones out logically. In TOS, this is done by gathering them together in
an invisible file.
This does not help Spectre or MINIX at all!
Of course, If you do not have the bad block list for your drive you have
a problem. Then you really need to buy the Adaptec manual ($5.00).
==
This is why I wrote my own formatter (minihdx.prg, and partitioner (mkfs.prg).
These are available if you can send me EMAIL.

1374. Notes for Europeans.

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 14:45:00 UTC
From: AMEIJ@vax.oxford.ac.UK
Message-ID: <9002080808.AA11968@ucbvax.Berkeley.EDU>
Source record: 243815

Hello.

This is a quick note to those European subscribers who through their ignorance are clogging up this newletter.

1) (Un)subscription. Do this through a listserver. The one I use is listserv@finhutc. If in doubt send your request to your nearest one and it will forward it. The message required is "(un)subscribe info-a16". Do not send such messages to the list itself - it only gives us a good laugh at your ignorance.

2) Submission. Send them to info-atari16@wsmr-simtel20.army.mil. It's up to you to find out how to get things there. UK users send it through uk.ac.nsfnet-relay. do not send things to Stanford, as they then get broadcast in uncollated form. Again, we snigger at your ignorance.

Got it? If not, a) ask someone who knows about these things and b) ask yourself if you are really suited to this form of communication. Perhaps it would be better to learn a little more first?

Jan Ameij.

1375. Re: Problems FTP'ing

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 15:07:33 UTC
From: SOFPJF@UOGUELPH.BITNET

Source record: 243816

The base note is a query about why ARC files may be corrupted, and
what FTP sites there are for only Atari software.
[Dave Small: Emulation is the sincerest form of flattery!]

I know of no sites that have ONLY atari-ST software, but here's one...
FTP 131.104.96.1, as anonymous, and you can FTP download to your heart's
content.

If your MAIL an INDEX PROG-A16 command to LISTSERV@UOGUELPH
(Note do NOT mail to PROG-A16@UOGUELPH !!), you can tell which files
are which. You can also request the files by mailing
GET PROG-A16 yy-nnnnn commands to LISTSERV@UOGUELPH

Best of luck.

As for your ARC problem, there are a number of things that could corrupt
an archive (curious, though, that you see such a regular error as that)
You did not give enough details:
1. Where do you do the UUD-ing?
If on the host then:
2. When transferring to the PC, do you tell the host to send BINARY?
3. Are you un-arc-ing on your PC or on the Atari?

And so on and so on. I'll be glad to help, but need more details.

Below is a list of all sites that have/had some Atari ST software:

026.003.000.095 mordor.s1.gov Atari ST?
035.001.001.043 ummts.cc.umich.edu atari st (cd PC7:)

I recently used this program to un-scramble a very scrambled partition on my Megafile 30. Only problem, was when I told it to reclaim unused clusters, it also reclaimed a cluster that was marked bad in my FAT. I had to restore it by hand using a sector editor (I happened to know what sector it was.) Are there any programs out there which don't have this "feature"?

This sounds suspiciously like the behaviour of one of the ST viruses
that George Woodside has catalogued. As far as I can recall, it's
harmless enough, with the exception of the curious mouse behaviour you
mention (no flames, please; I know that no virus is _truly_ harmless.)
Fetch VKILLER from the panarthea archives and check your disks if you
haven't already done so.

Last night while attempting to extract files using unlzh12.prg the system sat for a while blinking the drive light then crashed with 2 bombs. After rebooting the system I attempted to extract the files again using unlzh11.prg. It then came up with an error saying that there was insufficient space on Drive E to extract the files! Using the desktop show info it said that drive E had around 4 megs used with 0 bytes free. My E partition is a 16 meg partition! I then used fsck which quickly exited saying that all was fine! Around 1 year ago I wrote a program called dskana which bypassed all DOS calls, read the boot and partition blocks and with a built in driver read the FATs , directories and checked the blocks used by each file to make sure that they didn't use any more or less sectors than they should and also check to make sure they didn't use any blocks previously used while building a memory image of the FAT while tracing. At the end it compared it's FAT with the one on the DISK and showed a whole Sh*t load of blocks that were marked in use but not assigned to any particular file! Fortunatly I had the partition backed up so I had to use a SUPRA utility to 'clear' the partition which also cleared the directories and FAT entries. Just deleting all the files still left all those entries in the FAT since they weren't assigned to any files for directories.
My point is that FSCK didn't do the job for a standard 16 meg partition!
Now I'm working on dskana to not only find errors but to correct them. I'll also make it more general purpose and if I get it working I'll post it to whomever may want it.

>request a save before you have to reboot.

Just so; this is _definitely_ not a problem restricted to GST products.
As Fred goes on to note, WP Corp. has been aware of The Problem for a
long time; they claim that Atari Corp. has been uncooperative in
helping them track down its source.

Whatever; fact is, there's a real problem here, it's a royal pain in
the *ss, and whether or not it's a bug in TOS is not entirely relevant.
If it is a bug in TOS, then you as well as us should be interested in
getting it fixed as soon as possible (another patch?; at any rate a fix
for TOS 1.8). If on the other hand it really is a matter of developers
breaking rules, you should be interested in identifying the rule or
rules in question and warning developers of the consequences of
breaking them as soon as possible. Apparently WP Corp. and GST are
under the mistaken impression that they're not doing anything wrong,
which is making my life miserable, not to mention harming their sales
and ultimately Atari's.

Fortunately, The Problem hasn't hit me in WP for a couple of weeks
(even without the chicken blood and incantations :-). Prior to that it
seemed like I was getting bitten every other day or so. I don't have
any more of a clue than anyone else about how to replicate it, but for
what it's worth, I've noticed that The Problem is not unconnected with

mouse movement. I.e.: If I catch it before it gets out of hand (after the machine has started to crawl, but before it locks up completely), I can save my file and exit WP by moving the mouse slightly after each key press. Here's the scenario:

1. Machine slows to a crawl; keystrokes and mouseclicks have an effect only seconds after a key is pushed or button clicked.
2. I hit F7 ("Exit"). Nothing happens.
3. I move mouse slightly. "Save file?" dialogue pops us instantly.
4. I respond with "y". Nothing happens.
5. I move mouse slightly. File is saved, and "Exit?" dialogue pops up.
6. I respond with "y". Nothing happens... etc.

Does this behaviour suggest anything to anyone?

1382. LDW POWER problem

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 17:53:34 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9002070804.AA13067@ucbvax.Berkeley.EDU>
Source record: 243823

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

I have a problem with LDW POWER Spreadsheet and would like to know if any other users have this problem. The version of LDW that I am running is UK Version 1.03 (c) 1988, and I have a 520 STFM w/ 1meg.

The problem comes when printing out a spreadsheet (I use 70 line paper instead of the more usual 66 line paper, although it doesn't seem to matter how many lines I tell LDW I have!). During printing LDW inserts about 4 or 5 blank lines in the printout (whether to printer or file) in what seemed a random manner at first, then I noticed that the position of the extra blank lines seemed to be moving up the page each time I printed, until it reached the top and then it would cycle round and start from the bottom again!

At the moment to get round it I am printing to a file and then editing it using a text editor to remove the extra lines before printing.

Also, I have remembered to clear all the possible things that I could either think of or find in the manual, such as margins etc.

Any help here would be appreciated, I remember seeing a number of people talk about LDW and so I hope that someone out there has an answer.

Many thanks

Rat.

> "Do you suggest the left path?"
> Geoffrey Fagan (gefagan@uokmax.uucp)

Geoff, your getting to be like Chris. Why not hose
both tribes and then take either path.

Anyway, the correct question is:

To any one of the two tribesman:
Which path would the other tribesman say is the safest path?

Then take whatever path the tribesman DID NOT say was the safest.
Why? If the tribesman you ask is the one who lies, then he will
give the the opposite of the other tribesman answer (the answer being
the correct path).
If the tribesman you ask tells the truth, then he will give
you the wrong answer, because he is giving the liar's answer which is
wrong.

That will be 100 gold , please. Pay the dragon at the door as you leave.

1386. Re: Spectre GCR--SoundMaster questions--Hard Drive questions

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 18:46:36 UTC
From: oplinger@jupiter.crd.ge.com
Message-ID: <5124@crdgw1.crd.ge.com>
Source record: 243827

I haven't backed up my disk in a few months (from before I had a GCR), so this may not apply, although I cannot think of a reason why. PC Tools/MAC makes a reliable, fast disk backup. Good points are: I have saved/restored a 15 Mbyte partition regularly without problems. Pad points are: An obvious PC port (it isn't too bad but it ain't the 'real' thing), compressed files on floppies that the finder cannot read. This means that the program is required to restore files (but it does take less floppies than a non-compressed format.)

The above represent my observations about my circumstances. You milage may vary. The above does not represent an endorsement, just the story of a semi-satisfied customer.

>

I would love to be able to read the Gadgets newsletter from the net. Possible solution might be to upload it to comp.binaries.atari.st as a UUE'd ARC file. Or for that matter, Panarthea or Terminator would be great too. If you want a real novice's view/instructions on FTP, I would be happy to type something up, and mail it to you with a list of FTP sites. Reply to the address at the top.

1388. Re: Ataris and Midi

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 19:07:48 UTC
From: apolivka@x102a.harris-atd.com
Message-ID: <APOLIVKA.90Feb6140748@x102a.harris-atd.com>
Source record: 243829

I tried to E-mail this, but it bounced. So I'm posting it.

In article <4620@druwa.ATT.COM> dvac@druwa.ATT.COM (Daniel Vachon) writes:

>Our band is wanting to get into some Midi now that we have a Yamaha PTX8
>Electronic Drumkit, Yamaha TX16W Sampler, and a Kawai keyboard, all Midi..

>My question is directed to those Midi Mongers out there who play with midi
>all the time.... Is the Atari the best computer for Midi for the price?!

For the price, probably yes. It is one of the leading computers for running midi software because of the price (i.e. because it's the only one that has a built in Midi port so you don't have to buy nor hassle with that). Many big name musicians use Atari's.

>Is the midi software good?!

Yes. Since it is widely used (again, because of the built in midi interface), software developers have created a lot of midi software for it.

>I would like to get open-minded comments...So please give good and
>bad points about Midi on the Atari-ST.

The only serious downside that I can think of is that Atari support is dwindling in this country (not many dealers, etc.). Other (non-midi) software availablility might be a problem, depending on what you are looking for.

>Also, does most of the good
>Midi software work on both the 1040 and the 520?!

No! You would be making a serious mistake to buy a 520 (rather than a 1040) for midi use. I originally had a 520 and ended up having to upgrade. For example, the newer editions of Hybird Art's Miditrack sequencer (one of the decent Atari sequencer packages) will not run on a 520.

I recently conducted a poll on user groups rec.music.makers, rec.music.synth, and comp.music asking what computers/sequencers were used by the readers. The Mac was the most widely used and the Atari ST was second most widely used. You can see additional results of that poll if you read the postings on one of those newsgroups (look for "the Great Sequencer Poll"). I will also be posting an update to it this weekend.

BTW, I would seriously look at getting a laptop if you're going to use it in performances. Ordinary PC's are a pain to set-up, tear-down,

etc. to gigs.

>How can you say this? I think ST owners buy a larger share of
>software than users of ANY other computer. I know quite a number of
>ST owners, and EVERY ONE OF THEM has bought a lot of software,
>myself included!

I know, all of the ST owners (well, most) that I know are also
of good character, and they purchase what they use.

The reason I can say this is because I have attended ST User Group
meetings in three different communities. In all three cases, the
scene is entirely the same: a brief meeting is held, some software
is demoed, then what can only be described as an orgy of software
piracy begins. Its mallicious, its organized, and its massive.
There is usually two or three double disked STs set up, with an
operator at each. Club members bring their own diskettes, and they
are free to choose from a menu that not only includes public domain
and shareware, but also commercial copies of Lattice C, Word Perfect,
Games (there are copy protection buster programs available for all to
use), spredsheets, business software, etc etc etc...

I have *never* seen anything like it. When I brought it up to those
present, the attitude was pretty similar to what I've seen on this
net: either alot of snickering "why shouldn't we?" to "Hey, we have to
test this tuff out before we buy it, don't we?" Quite literally
100's of copies of commercial software left the premises on those
evenings.

I have been to IBM and Amiga user gorup meetings, and I have
never seen that type of blatant theft. Sure, there were some
mumbled exchanges of unlabeled disks between people, but nothing
on the scale or magnitude that I have seen at Atari meetings.

The only Atari meetings where I have not seen that activity are meetings
conducted by the BCS is Boston.

>I refuse to believe that ST owners pirate worse than their IBM/Mac/Amiga

1392. HELP! Floppy Drive not working out.

Newsgroup: comp.sys.atari.st
Date: 1990-02-06 20:44:32 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <34157@ucbvax.BERKELEY.EDU>
Source record: 243833

Since I did not get any replies last time:

I'm having a big problem. I bought a 1.44Mb (high density) 3.5" floppy drive to replace the SS/DD drive I have now. My plan was to just pop the drive in and use it like an ordinary DS/DD drive, not a DS/HD drive. Well, it didn't work.

So far, all that happens is that the floppy acknowledges its existence. When I try to read, the light flashes on, but the computer cannot read the data on the diskette. When I formatted a diskette on it, the head did not move, and the end result was a diskette that claims to have 0 bytes used, 0 bytes free, and 0 everything else.

The drive is a Toshiba. That might have something to do with it; I recall seeing things about that drive before.

Last night I was reading a note posted by someone "whining" that
the firm making PC-DITTO wouldn't let him buy the newest version
at half price because he missed the cut off by 7 months.
(The particular product is not the issue here).
His view was that he had only neglected to send in his registration.

Seems that only something good can come from registering what you buy.
In this case he lost $150 value by not doing so.

>of TOS 1.0 or 1.1 or whatever it is in my 1040, allow for larger
>partitions? Did some of the later versions of the driver program
>allow for larger partitions, patching TOS appropriately?

One reason there was a 16M limit on hard disk partitions is because the Rwabs() function which does the physical I/O is specified as taking a signed integer (16 bit) value for the "recno" parameter. This means that the sector number can only range from 0 to 32767, for a total of 32768 sectors. Since Atari-compatible disks have 512 bytes per sector, that means you are limited to 32768 * 512 = 16 777 216 bytes (16 Megabytes) per partition.

What Atari has changed, I believe, is to treat the "recno" parameter as an UNSIGNED int, with a range of 0 to 65535, and consequently a 32Mb limit. However, any software which calls Rwabs() to directly access the hard disk (such as disk checkers might do) must understand this convention, or else they will get confused by the (apparently) negative sector numbers (i.e. any in the second 16 Meg with the high-order bit set).

Personally, I am absolutely paranoid about hard disk integrity, and will limit myself to 16 Meg or smaller partitions. Besides, once you get about 4 Meg of stuff in a partition, the old Dfree()/FAT search bug rears up, and file creation takes nearly forever. It is, however, a good motivation to get Rainbow TOS.

<<<<<<<<<<<<<<<<<<<<<<<<<<<< WARNING >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Under TOS 1.0,1.2, and 1.4 repeated use of Getbpb or Dfree will bring your system crashing to a halt! The number of calls until failure depends on your system memory utilization but averages in the 35-65 call range. This little bug(feature) was discovered at great loss of time, sleep, and hair (with a number of forehead bruises also). The real moral of the story is never let someone else do what you can do yourself. Read in the boot sector and pull the sector size off there!

I strongly agree with Alan that it is the developers responsibility to query the system and never to take anything for granted.

A person in our user's group has successfully installed a PC Ditto II.
According to him, it has a Norton SI of 4.2. He has a 1040ST. However,
he noted that he has to use DOS 2.1 for it to work. Anything above that
does not work because of the timing problem. He recently received it,
so maybe AG finally got some working.

> me how I, who lives in Arizona USA, can get the update. Heck, WERCS is
> worth buying all over again if I could just get a working version!!

I've had a number of problems with WERCS myself (I think I've got version 1.08). I called Michtron a while back and asked whether the problems had been fixed. The person I talked to didn't know about the fixes, but did know that an update to version 1.24 was available. I haven't gotten around to it yet because I've been doing all my work in K-Resource recently.

To get the update, send $5 plus your master disk to Michtron (plus your Registration card if you haven't sent it yet). There may be an even later update by now. You can call them at (313) 334-5700 to find out.

If Hisoft has a newer version than Michtron, I'd be interested in hearing about it.

>answer to my dreams.

The only thing I can think of about Lattice is that I think it uses
32 bit ints and the RTX stack frames are expecting 16-bit ints and
32-bit longs. You will have to hack the RTXBIND.S glue routines
to set up the RTX stacks with the correct 16/32 bit values in the
right places before you make the trap #5 call. I also remember
that the Lattice startup does do some strange things and Lattice
is NOT a supported language for commercial RTX use (that means
even if you pay, we won't help you if you're using Lattice C --
you're on your own).

>the GEM/ST specific stuff.

Very. In fact, for the docs the term translation comes to mind :-) The editor
is wired up rather differently (keybindings/menu structure), but with the same
functionality. Given that the menus are in English, a TC PC 1.5 manual should
work fine.

1407. PCB-layout (again)

Newsgroup: comp.sys.atari.st
Date: 1990-02-07 07:34:49 UTC
From: jackin@vehka.uta.fi
Message-ID: <905@kielo.uta.fi>
Source record: 243849

I have asked this once before, but got only two
replys (thanks guys).

==========

Is there a GOOD PCB-layouting program for ST ?

==========

Good one has AUTO-routing and libraries. Price
is not an issue here (my friend is ready to pay
for quality). If he can't find any he is forced
to buy either PC (yuck !) or MAC.

If there is general interest I shall compile.

Markku M{enp{{, jackin@vehka.uta.fi

It isn't Abaq anymore, its ATW now, the Atari Transputer Workstation.
So if you or anybody else is still looking for info on the Abaq, forget
it. Look around for infos on the ATW instead.

Since I happen to have a Z-RAM 2.5 Meg kit sitting here in front of me, soon to be installed, I can easily give you the address:

Zubair Interfaces, Inc.
5243 B Paramount Blvd.
Lakewood, CA 90712
Tel: (213) 408-6715 Fax: (213) 408-6748

The kit is solderless, uses sixteen 1 Mbit RAM chips, and fits entirely in the video-shifter box of your ST.

It consists of a "Main Board" and a "Pingrid" board. The former fits into the Videoshifter chip socket (and the video-shifter chip fits on top of it). The Pingrid board fits into the MMU socket and the MMU plugs into it.

Basicly, Yes!
1. Make sure that the replacement is the same type. That is, MFM, RLL, SCSI.
2. Give some thought to the power supply capacity in the SUPRA box. As
they supported many drives, it can probably handle whatever you buy.

If there is an Adaptec 4000A inside, its MFM.
If there is an Adaptec 4070A inside, its RLL.

[writes about organized piracy by Atari 'User Groups']

If you're ever in the Washington D.C. area, stop in on a NOVATARI meeting - 2nd Sunday of the month, in Springfield VA. You should be pleasantly surprised. We exchange useful information, present demos, and sell PD/shareware disks. The only commercial s/w exchanged is sales of used packages w/original disks.

We're a user's group, not a pirate's club. If you know of so called user's groups that are only fronts for pirates, I suggest you report them to Atari or any interested software houses and have them shut down. They give all user's groups a bad name.

A Two way link with GEnie would be fine if it would save me some $$ on my GEnie bill :-)

Also, is there anyway to get linked to GEnie's files?? I d/l quite a bit of GEnie files and it gets expensive!!

But, try to link in with GBS on Genie at the very least. I am sure that ther are plenty of USENETers who have Spectres but can't link to GEnie, and GBS has a great RT on GEnie. It would be worth a two way link just to see the GBS GEnie RT linked to USENET.

Just a few thoughts.

Good luck Dave

1417. TeX and DVISLM; PageStream 1.8; LHARC

Newsgroup: comp.sys.atari.st
Date: 1990-02-07 15:52:37 UTC
From: steveg@SAIC.COM
Message-ID: <9002071552.AA10408@SAIC.COM>
Source record: 243757

To the person asking about output quality from TeX on
the SLM804 Laser:

I've got the distribution of TeX from the Current Notes library, and
while I haven't used it all that much yet, I have printed out the
manual for Uniterm by Simon Poole (a great PD terminal emulator). The
output quality is excellent. Even small footnotes (6pt?) are quite
readable and do not suffer from the 'thinness' problem you described.
I suspect you do not have a complete set of fonts for the laser (I had
to generate a couple myself for the manual).

to R. Covert, re: PageStream 1.8:

Kudos for PageStream from our resident critic? :-)
I agree it's a powerful package, but it's still not bug free. As I
mentioned a while back, it does a pretty poor job of cleaning up after
itself on the screen (even with an apparent 're-draw it all' attitude)
- I'm constantly getting object 'handles' left all over the place.
Also, UNDO does not work for all operations and you don't know what is
not UNDOable till it's too late. It's getting better though.

Re: LHARC

Has anyone gotten the LHARC source code recently posted to compile
under Mark Williams C? It seems to need some header files I don't
have - file.h, dir.h. It compiles fine on our Sun workstations,
but I want a version to use at home. Can anyone send me the
neccessary changes or point me to an ST executable version?

From: menton%v5130c.decnet@CCF3.NRL.NAVY.MIL
Message-ID: <9002080807.AA11869@ucbvax.Berkeley.EDU>
Source record: 243759

Is anyone using the terminal program "Mac240" under David Small's Spectre GCR Mac emulator? The keypad functions do not seem to work, other than echoing similar keys on the main keyboard. I tried invoking the 'Mac Plus' mode in Spectre, but no change. Using Mac240 to log onto a VAX, it's very inconvenient to do EDT keypad editing by using pull-down menus; direct use of the keypad keys would be much better. By the way, EDT keypad editing IS supported in Mac240 when run on a Mac II (and other Macs with keypads, I would guess).

What exactly does the host adapter need to do? How similar
are the protocols between the Atari DMA interface and a standard
disk controller? How about between DMA and SCSI controllers?

In particular, with a priority on fun rather than saving money,
what would be involved in actually building one of these interfaces?
Would it be a simple FSM protocol converter with some buffering or
are there more complicated things necessary?

Also, where can I get technical information on controller details
and the Atari DMA port?

Finally, I got mail from one person who said he built a simple
host adapter and offerred me schamatics. I wasn't able to get my
reply back to him. If he reads this, I would be interested in
any technical info/schematics!

Thanks,

From: david@bdt.UUCP
Message-ID: <1182@bdt.UUCP>
Source record: 243787

[This was originally intended to go out as mail to John Stanley,
but that bounces. I think this may be interested to the net anyway.]

John Stanley said:
> I saw RTX come across the net, but due to a hardware problem, I
> missed most of the posting and am probably going to have to grab it
> off of GEnie if/when I do have a machine with enough memory back up
> and running (now using a badly overloaded/under-RAM'ed 1040 and my
> primary machine (4+meg 1040) is still in the shop..<sigh>)..

To use the basic RTX kernel, you really don't need that much memory.
It's designed to be lean and mean. The kernel itself uses only about
32K. You can proably run the whole thing in less than 100K.

Re Fforce etc.:

I don't think you're going to need the Pexec+HBlank trick when RTX
is running. Can you explain a little bit more why it is needed under
RTX? I don't think there's any way to guarantee this is going to
work in a multitasking system where the process doing the Pexec could
be suspended at any time during the start of the child. What's more
the child may be started concurently. There is a "p_create()" RTX
hook that could be used to guarantee that your "extra startup" stuff
happened in the correct context.

I'll explain a little bit about how Fforce works in RTX. There isn't
any "stack". RTX follows the GEMDOS / PC-DOS definition of handles.
Each process has a set of "standard handles". These may be redirected.
In RTX there is an internal table of "active" handles. This table
contains information about all active handles, both "standard handles"
and "non-standard handles". Each handle is "owned" by a certain
process. Standard handles are really just a per-process table of
six entries in the "active" table (a double indirect). When Fforce
is used, the entry in the "active" table for the non-standard handle
is copied to the entry for the standard handle. If a process closes
one of its standard handles, it basically has no effect. The handle
actually remains active and open; the Fclose() call returns with an
EIHNDL error. When the process terminates, all its "active" handles
are "freed" and files and pipes opened in this process context are
closed. Files opened by the parent, and redirected are not closed.
RTX also "knows" how each handle is opened, in terms of what it's
talking to and it deals with the different handles (files, pipes,
and ttys) differently. Any owner of a handle can determine what
the handle is talking to via the Fcntrl() and Ftype() calls. File
operations attempted on handles not owned by the correct process
result in EIHNDL errors.

Neither GEMDOS nor PC-DOS are defined to "stack" Fforce. It's not
the way that redirection is done under MS-DOS type systems. Correctly
written GEMDOS / PC-DOS programs don't expect Fforce to "stack";
Fdup() is the stacking mechanism. Programs that rely on other
methods are out-of-spec and therefore are in error. If they don't work
right, tough. They have a bug unless they use the supported method
of redirection. Closing a standarnd handle isn't fatal in RTX
though -- it's basically a no-op.

Many times with RTX there are cleaner ways to solve a problem using
documented system services, such as Fcntrl(), Ftype() etc.

As for detecting the presense of RTX, the easiest and "cleanest"
way is to just try to use one of the RTX GEMDOS extension traps,
such as Ftype() on handle zero (STDIN). Ftype is GEMDOS opcode
0x101. In standard GEMDOS, this always will return EINVFN
(-32, invalid function). In RTX this will return some number
between zero and seventeen. Using the C bindings, you could
just use:

```
if (gemdos(0x101, 0) == EINVFN)
/* no, RTX isn't here */
else
/* yes, RTX is here */
```

If you wanted to be more sure, you could validate the return
from the gemdos call more, but the above has always worked
and probably always will. No other GEMDOS stealers have
used opcode 0x101 yet. The other thing that is much uglier
is that yoou could look at the value at the RTX vector for
trap #4 (at $94) and see if it has the high byte set or
not. If it is set, then RTX isn't loaded at all. If it
is set, then RTX may be loaded, but you can't be sure if
it's active or not until you try something like the Ftype(0)
check above.

The nice thing about the Ftype(0) check is that it's a NO-OP
in RTX and also regular GEMDOS. It doesn't hurt anything.
It's fast and it's reliable. TOS always safely returns EINVFN
when given an out-of-range function number.

>ATT Bell Labs
>=====NEW address====

Thanks for responding.
The denoument:

Briefly,

When i got GCR, i went into Supra to low-level format
my Quantum 80S (84MB drive). Starting from C:\, i worked my way
down like so: 9MB, 9MB, 6MB, 15MB, 4.5MB, 10MB, and when i did
CALCULATE, the window showed 30.19 .. so i set my SEVENTH
partition to 30.19.. did CALCULATE and got EXCESS is 0.00.
Partition I:\ was 30.19, Supra gave me a *WARNING* that this
partition could not be used for GEMDOS... i clicked on CONTINUE..
i formatted the drive.. all 164,000+ sectors with 0 BAD SECTORS
(the Quantum has a built-in SCSI).. I then went into Spectre and
proceeded to format the last 3 partitions (G:\ H:\ and I:\) to
MAC HFS format.. it was in SPectre that i noticed two more partitions
of 12MB and 6MB respectively. The Spectre format utility shows
the type and size of each partition.. all the sizes looked accurate
.. including the 30MB partition number 7. For experiment, i decided

to format partitions G-I PLUS the "new" partitions at the end for
HFS mac mode... i wanted to see if i could write to the new partitions.
Spectre formatted them in seconds.. i then booted up into mac mode
and opened up all 5 windows.. checked sizes and so on... they
all looked correct... i then started loading a bunch of PD stuff
and so on onto the outer last two partitions.. reading and writing
to them was perfectly flawless.. i then wrote to the 30MB and all
was well there too.... it wasn't until i tried to really
load up the 30MB that i found that it couldn't take more than
12MB... i finally realized that these partitions were the sizes
i had BEFORE getting GCR....

I went back into Supra and discovered what had really happened.
I don't think this is a case of user idocy.. others may in fact
think so...:

I examined the partition sizes in the format window...
everything checked out fine.. but then i noticed beyond the
30MB partition.. i had to scroll the windo there.. were the
two partitions J:\12MB and K:\6MB ..! now.. this was obviously
the problem... My question is: why when i originally set the
partition sizes did those two still exist even after the 30.19
meg set the excess to 0.00? Seem like Supra should have realized
the numbers added up to over 100MB for an 80MB controller..
Never was there a warning.. also.. becasue the windo only shows
4 partitions at a time.. those last ones were not visible as
i set my "last" one to 30.19. I must not have seen the grayed
scroll bar... nonetheless, this doesn't justify the formatting
routine to continue with "apparent" success...! Not only that,
Supra did NOT format the 30MB partition, instead, it defaulted
to the original 12MB... and then formatted the ones that shouldn't
have been there.... what was strange, of course, is that
the formatting utility window showed 30MB still... even though
we all know there was only 12MB in there..... NOt only that..
i went so far as to use these partitions under the MAC OS..

anyway... when i look back at it... the formatting should never
have proceeded... also.. i think that when someone resets the
partition sizes and begins at C:\
works the way down until EXCESS = 0.00 .. doesn't seem like
there should be any partitions lurking under some scroll
bar....

-kevin
ramsiri@blake.acs.washington.edu

BTW: it would have been a more interesting problem if
what Howard thought were actually true.. at least my
aggravation would have been worth something...

1424. Re: Testing that programs conform to TOS rules

Newsgroup: comp.sys.atari.st

From: david@bdt.UUCP
Message-ID: <1186@bdt.UUCP>
Source record: 243761

I think a TOS validation test suite TSR is a really good idea.
The part about not having the TOS private variables there
while the program is running is tricky because of the TOS
interrupt handlers. Also only Atari knows for sure where
these variables are, so only Atari could "really" do this part
correctly.

I have a system call profiler which I use to see what system
calls a program uses, which could be the start of such a
program, if anyone is interested in running with this idea.

I like it.

I think that this is illegal in California. I do know that you are entitled to
a full warranty under California law whether or not you send in your card.
Updates might be another matter however.

From: <phch020@dwuuni21.BITNET> "Th.-M. Kruel"
To: <info-atari16@score.STANFORD.EDU>
Subject: Inquiring GDOS Status for Prospero Languages

Two weeks ago I asked about how to inquire GDOS. Thanks to all who posted.
Here is the solution suitable for Prospero languages:
(adapted to Prospero Macro assembler)

xdef vq_gdos ; announce global reference

section .code

vq_gdos
movea.l 4(sp),a0 ; get address of the argument
move.w #-2,d0 ; set d0 to -2
trap #2 ; call system (GDOS will modify d0)
cmp.w #-2,d0 ; compare d0 with -2
sne d0 ; test condition, sets d0 = 0 if true, otherwise -1
ext.w d0 ; extend to 16 bit
move.w d0,(a0) ; move d0 to address in a0

move.l (sp)+,a0 ; move stackpointer to a0
adda.w #4,sp ; add 4
jmp (a0) ; jump to the address in a0 (back to calling program)

from Pascal: vq_gdos (i_gdos) (where: var i_gdos:integer2)
returns -1 if GDOS loaded, otherwise 0.

Well, all I can say is that WE DON'T DO THAT at PHAST!!!

I repeat
WE DON'T DO THAT at PHAST!!!WE DON'T DO THAT at PHAST!!!
WE DON'T DO THAT at PHAST!!!
WE DON'T DO THAT at PHAST!!!

I have never heard of Atari clubs doing that. When I lived in Denver I attended
both 8bit and ST clubs, and in neither club was Piracy allowed!!! In fact,
it was never even mentioned in the Denver clubs.

And I know for a fact that we don't pirate software in Phoenix. I work as a full time programmer and there is NO WAY that I would be President of a Club that allowed, or even tolerated, Piracy.

I don't know how many other clubs do allow that, but you can attend any of our club meetings, which are always held on the Second Saturday of the month, and see for yourself!!

In fact, I am trying to get Special Interest Groups started so that we can split up after the demos (gotta wow the folks with the latest games :-)) and talk about favorite programs. I sent out a survey this week to all members to find out what they what in a meeting.

1429. Using Atari mono-monitor as a composite monitor

Newsgroup: comp.sys.atari.st
Date: 1990-02-08 01:24:23 UTC
From: etruscan@cory.Berkeley.EDU
Message-ID: <21880@pasteur.Berkeley.EDU>
Source record: 243768

Hi,

Does anyone know if the Atari monochrome monitor can be used as a composite monitor? I know this would require making a special cable, but that's no problem as long as I know which pins are what. Which brings me to my next question; where can I obtain a pin layout for my monitor?

I plan on using my Atari 800 again and need a composite monitor (old one is broken).

If anyone knows where I can get a *cheap* used *color* composite monitor (computer flea market?), please tell me.

>> If this is the same monitor which was being sold under the Commodore
>> nameplate as the 1084 for a while, it is junk. Ask any 1084 owner
>
>WHY is it "JUNK"? maybe you could enlighten me(us) on this...

There are two main problems that Magnavox/1084 owners have had:

1) It frequently goes blurry in interlace mode. This may not matter
to Atari owners, since they don't use interlace mode, but I use it all
the time and I have to live with this flaw every day. I've brought
it to the repair shop, and they can't figure it out.

2) The picture on the monitor snaps every couple of minutes. This seems
to be curable.

In addition, there have been several reports in the comp.sys.amiga about
bad solder joints being found inside the monitor, which have caused
intermittent failures.

>I have had NO PROBLEMS WHATSOEVER with mine. (It is a year newer than the
>Commodore-1084 model that Magnavox made--but for all intents and purposes,
>it's the same monitor...)

Great. I don't claim that every single monitor is bad, but they do
seem to have had a pretty big quality control problem there
for a while. Maybe they've since fixed it.

>Maybe you should do your research a little better commode-door owner!
>
>PHILLIPS CORP. IS THE PARENT COMPANY OF MAGNAVOX!!!

Oh well, I was only guessing. I thought I'd heard that Philips was
the new manufacturer. Maybe not. Even if they are, there is no reason
that a company couldn't have one bad model and another perfectly good one.

Look, I was only trying to warn you of the experiences we Amiga owners
have had with one of the monitors that were being mentioned as possible
replacements for the Atari monitor. Why did that warrant such a violent
reaction?

> (S54394GR at ETSUACAD)

Make sure you set it to binary mode (usually the command 'binary'). To get ls to work after you have done this, you must set it back to ascii (with, you guessed it, 'ascii'). If you still have the problem, try setting it to telex (I think, something like that). Usually a '?' will get you a help sheet.

I have used UniTerm to print and save Tek MetaFiles with no problem. It seems to work depending upon which GDOS you're using. Of course, the printer and meta.sys file must be in your assign.sys file. But, I have found that with EXACTLY the same assign.sys file, UniTerm would print with my G+Plus but would NOT work with the ACM GDOS included with the Gemini desktop. Don't ask me why, it's a mystery to me. By the way, I finally discovered a program to convert the .GEM files produced by UniTerm into the standard .GEM format. If there are enough requests I will post it to comp.binaries.atari.st. It can be found on GEnie as well.

Please stop by a meeting of the Atari Computer Owners of Rochester, NY.
You will see a group of dedicated Atari owners teaching newcomers how
to use their machines, a groups of users talking about the latest
Atari "gossip", demos of the newest programs, talks by developers, dealers,
and "experts", and, NO PIRACY!

Our club, as do many other groups, has a strict policy against software piracy
in any form. Swapping of commercial software is prohibited at our meetings
and on our bbs.

You will never see an "orgy of software piracy" at an ACORN meeting.

[The basenote discusses using ST disks in MSDOS machines, and the troubles thereof].

I've had trouble under TOS 1.4 with Toshiba disks as well -- double sided, MS-DOS, DOS 3.3, off a Toshiba 1200HB. One time I read a file into the ST, and got the 1st sector repeated for the length of the file. Many times directory changes (cd) fail or act weirdly. I always have to ARC (to get a quick & dirty CRC) to make sure the file transferred ... it's that flaky.

I've been told that Toshibas do something especially strange that makes things worse, but do not recall the details.

1437. Geminimore thinsgs about Gemini

Newsgroup: comp.sys.atari.st
Date: 1990-02-08 08:05:19 UTC
From: ONM65@DMSWWU1A.BITNET
Message-ID: <9002072216.AA00639@hugin.math.dmswwu>
Source record: 243778

I forgot to mention a very important thing about Gemini.

The version which someone posted to american mailbox systems WON'T run on the TOS version 1.0 (old ROM-TOS from 1986), because it relies on features only available in TOS version higher than 1.0 (Blitter TOS, Rainbow TOS, etc.). Don't be alarmed: you won't need any patch programs on future ROM releases.

For old fashioned users there is no need to dispair: we have standalone versions of Mupfel and Venus (Gemini is made out of them) and they can run on the old TOS. We will post them together with the english version of Gemini at the beginning of march, I hope.

1438. Re: Hard drive question

Newsgroup: comp.sys.atari.st
Date: 1990-02-08 08:05:46 UTC
From: dsmall@well.sf.ca.us
Message-ID: <16036@well.sf.ca.us>
Source record: 243779

[The basenote asks if a new mechanism can be put into a Supradrive 20].

well, maybe. You'll have to open it up and look. It may be an integral controller drive (unlikely); it may be a controller that won't talk to other drives decently (possible); it may be some custom weird setup.

Basically, you'll probably see:

1) Cable to Atari DMA port
2) ACSI to SCSI converter board of some time
3) 50 pin SCSI cable
4) Disk Controller
5) 34 & 20 pin cables to drive
6) drive
--
7) power supply

inside the drive, hooked together in that order.

Generally, if you know what you're doing, you can unhook the 34 and 20 pin cables & power, put another mech in, and it'll go. But there are all sorts of gotchas here possible. If you have a particular drive in mind, I might be able to tell you; I've been "got" a lot.

Anyway, open it up and tell us what you have; it'll help determine what you can do.

I took my SH-204 and made it into a 80-odd meg system, and the base of a 240 meg system (4 x 60). Those components can go a long way with a few clamp-on 50 pin connectors and cable.

Ref: Key Pad problems

I have the same problem when using TINCAN V3.0 with IBM mainframe to logon to BITNET all PF keys do not work at all. I am now stop logon under Spectre Macintosh mode but using the program called PC INTERCOM. It is quite an old pro gram but allowing me to config Atari function key to put in my Account No, Pass word, and other command wich saving a lot of time than keying them in every time. Only drawback is that this program does not have PCTRANS file transfer protocol. It got kermit though. I use Kermit to tranfer all Atari files to my computer. As for the Mac program I will log on with PC Intercom and set every thing ready for file transfer then quit PC Intercom while still online. Switch to Spectre and run TINCAN to download Mac program with PCTRANS protocol. It save time from using Transverter to convert to MFS format. I can just BINHEX it and unstuff. I also have not try to config PF key for the RedRyder but seems that many netters are using this Program. Suthipuntha, School of Architecture Nat. Univ. of Singaapore

From: neil@cs.hw.ac.uk
Message-ID: <4336@brahma.cs.hw.ac.uk>
Source record: 243783

Well I now have TOS 1.4 ("Great! Perhaps he'll stop moaning now"),
I actually had to send Atari UK the blank EPROMs to get it which I guess
beats anyone elses sob story. Do you think if I send them some chips and
solder they could make me a TT :-)
I didn't get any kind of release notes (user or developer) with it, just the
chips and a letter so I've requested them again.

First impressions?
I *LOVE* it!
Faster disk access
Beautiful file selector
Reset from keyboard
TPA almost back at TOS 1.00 level
Disk copy more intelligent (copies 10SPT)
Copy/Move file dialog shows what's happening
Fastload

These are just the first few things I tried out or discovered and I'm looking
forward to the rest. Many many thanks to Allan, Ken and everyone else at Atari
US who worked so hard to make this TOS the best yet. Any hope of the 1.0
patch?

Sadly I'm probably the last UK developer to get Rainbow TOS. If not send your
answers on a postcard to Atari UK ...
Who knows when Joe User will get a look at it. Soon we all hope.

As requested:

a) What happened: Tempus II started delaying by tens of seconds between keypress and effect. This was only in one file: another could be edited fine, but on reloading the first the same happened. Hard reboot solved the problem.

b) Hardware: Mega 2, nothing else

c) Software: foldr200.prg, filefix.acc, S.I.Ramdisk @ 1Mb, Tempus II

End of Report.

Question/poser for hardware hackers.

Our office Mega 4 has died. At switch on it flashes the keyboard light, and if the volume is turned up throbs (bit softer than a click) loudly. Of course we know the safety implicationsof fiddling with these things, so we immediately opened it up and found the following...

The throbbing is synchonised to the PS fan wobbling to and fro. If we flick start the fan the machine boots, but we get the "no keyboard" scream and no response to keyboard or mouse. If we unplug the PSU from the motherboard it starts fine (no need to flick the fan) and if we then plug it back into the motherboard the system boots and all is hunky dory.

A bit of scope bashing reveals 'orrible spikes (about 25V worth) on the 12V line which runs the fan when it is quivering, and nice smooth volts everywhere else, anytime else.

Any ideas, guys? My guess is that that big electrolytic beside the PSU has blown and is stuffing the 12V line, which in turn is stuffing the fan, but replies from experienced bods are very welcome.

Jan Ameij
Oxford University Department of Applied Metaphysics,
ameij@uk.ac.oxford.vax

Another message, primarily to Europeans...

Since, alas, it looks as if Info-Atari16 is Doomed, should we be thinking about setting up a European Technical ST mailing list. It seems that most of the ST interest and expertise is over here and it would be nice to go on sharing it. Also, we might lose those whinging "Atari won't sell me a 100GFlop vector processor for $200 - do you know how much IBM that would buy" etc comments that waste all our time!

Long live the European Third World (insult copyright RC, 1990!)

I have missed the discussion on Abaq whatever that is but if it is the ATW (Atari transputer workstation) Then they do exist. We here in Newcastle University (UK) have a few. These systems where perchased either from ATARI UK or PERIHELION. These systems are being used for a major research project into fault tolerent distributed computing (ARJUNA).

Yep - this one strikes me too! I've never ever seen this problem mentioned in the ST mags or anything - is it common?

I sometimes get some kind of infinitely repeated keys, but normally only during bootup. I do boot however, with a small clock setter (SUPCLKRD - the Supra one) which sets the IKBD's version of the time/date (the new version does, at least).

I'm pretty careful about touching the mouse - I don't think it matters if the mouse is moved, or not - it seems to happen 'randomly'. Also, sometimes the whole machine crashes after doing all the \AUTO*.PRGs, with 3 bombs. Again, 'randomly'. Maybe it has something to do with the IKBD's time! :-)

System: 1040STFM, Mono, TOS 1.0, AUTO contents in order: SUPCLKRD, FOLDR180, DCACHE, LGSELECT, G+PLUS. I've also had it with a bare bones AUTO: SUPCLKRD. Other progs to look at/change the IKBD during bootup seem to die too, so Supra isn't the culprit!

Personally I suspect a bug in the IKBD's ROM. Any 6301 hackers out there?

I don't have the MegaMax-C compiler, so I can't test this out, but the 68000 has two distinct sets of instructions for dealing with address and data registers. The move.l instruction is for data registers. You might want to try the movea.l instruction instead. If neither of these work for you in the MegaMax assembly escapes, try using lea init, a0 (load effective address to A0) instead. This has the same effect.

Bob, I am writing Yet Another Disk Backup Program (YADBP tm of ME!!) and just how can I get the disk free space of a mountable device (like a floppy, or a sysquest cartidge, or even an optical floppy!!) if I can not rely on the repeated use of dfree??

This is a serious bug for me because I had planned to just call dfree() and be done with it. Now I need some other routine. I guess I can take your hint about reading the boot sector and getting the sector size from there. But are there risks in doing that?? Will that crash the system also?? Or does someone have a non-crashing version of dfree() that I can use?

Does any one have C code (or ASM that is callable by MWC) that will work w/o crashing the system??

HELP!!!

Mark (and to whomelse it may concern), I just got off the phone with Michtron. I mailed them my original disk and $5 last Wednesday (Jan 31 1990) and called to ask about wheither Michtron had received it. I was told that not have they received my disk, but that they shipped my upgrade Tuesday Feb 6 1990.

I didn't receive it in yesterday's mail, but I am hopeful that I will get it by Saturday. I will post and let you all know what version number they shipped. I was told on the phone though that they had version 1.6 not 1.24 and that it was dated Jan 1989m which still seems kinda old. But, I will just have to wait until I get my upgrade to know exactly what they shipped. I sure hope that it doesn't crash (trash) my HRD files like my old version does. One of the nice features of WERCS is that it allows long variable names, which I really like. Also it has a test mode where you can test out dialog boxes from within WERCS. All in all, I like it better than the MWC RSC Editor or The K-Resource RSC Editor.

I want to think Michtron for shipping so promptly. Sounds like a good company.

>to fix this problem?
Are you passing the rtxbind.o to the linker explicitly, or have you
put it in your dlibs.a ? just putting it in the lib directory won't work.

>for Fforce? or does micrortx patch Fforce? micrortx seems like a
>fantastic package, and I will register for it if I can use it
>effectively.

I really think it's worth the price. If you are using dlibs, you will
have to change initargs.c in the last part, where it tries to get
the program name from the parent memory (I guess). the line containing
something like p= *(p + 0x36) (I think) must be checked if p != NULL,
and argv[0] set to something reasonable, else the program will crash.

That means you have to recompile all programs that were compiled with
dLibs (of course, even the compiler, linker etc.) if you want to
use them under RTX.

I've build a small root program, a "backgrounder" (i.e., a program that
can be accessed from other programs and starts background jobs), and a
cron utility last weekend. I am starting gulam as the main shell from
the root program and am very happy with RTX doing all the background work
(hopefully also running uucp etc.)

If there is enough interest, I might post the sources after some cosmetic
cleanups, so others may avoid doing the same mistakes that I made 8-) .

Well, when a file is ARCed it turns it from whatever format it was in into binary format (ie. requiring all 8 bits in a byte). ftp, by default, transfers ASCII which is only 7 bit data and it will do conversions on things like 'end of line' characters etc. To stop it doing all this you need to type:

ftp> binary

at the ftp prompt. This allows any kind of data to get through without change.

I hope this works for you.

I find this very hard to believe. I belong to a Users Group (LAUG)
in St. Charles, IL (west of Chicago). We are extremely anti-piracy.
There are no copyrighted programs in our Library and we do not
allow any to be brought to the meetings or exchanged there. I know
that the policy at SCAT (another Chicago users group) is the same.

I would be naive to think that no one there has these type of
programs at home, but they are not brought or discussed at any of
our meetings. I just can't imagine there are very many Atari User
Groups that condone such activity. Are you sure that you aren't
a MS-DOSer trying to spread rumors?

I just got the august 89 release of WP today directly from the company.
Unfortunately, in my coorespondance with other WP users I accidentally
deleted most of the messages I received.

But I recall one person telling me that August 18, 1989 was no longer
the current version of WordPerfect, and that there is a newer one out
already.

Does anyone have it? How is it different? Why didn't WP send me this one?

FSF's GNU project C++ is available (in not fully-debugged form) from a couple of FTP'able sites -- terminator.cc.umich.edu is one -- but from all reports it requires at least 2Mbytes to run, 4M to do anything serious, so an unexpanded 1040ST is not enough. If you have a Mega or have expanded your ST's memory, you might want to check it out.

From: roeder@sbsvax.cs.uni-sb.de
Message-ID: <2683@sbsvax.cs.uni-sb.de>
Source record: 243741

Some weeks ago, before emacs came out on comp.binaries.atari.st, i posted a binary patch for temacs. This patch seems to change the probability of the bug, which should be fixed from 1:100 to 50:100 (:-(). More and more people tell me that they have problems with this patch (system crashes after the timeout for the startup-screen). The correct solution for this problem can't be done with a simple binary patch (the program size will increase more than a few bytes).
So please forget about this patch!

The original bug will probably never hit you anyway.

>the typing stops.

What you describe is _not_ the infamous "phantom typist"; it is rather the well-documented problem of the machine spewing out an infinite series of escape characters until a key is pressed. The latter problem is generally harmless enough (unless, that is, your application does something quirky with escapes); if memory serves, the experts attribute the behaviour in question to applications spending too long in interrupts.

You can tell that your machine is possessed by the real phantom typist when you're typing merrily away and suddenly the machine slows down dramatically, or appears to lock up altogether. If you stare at the screen long enough, the characters which you typed when the machine began to slow down will eventually be read from the keyboard buffer, one by one, at an abominably slow rate (ranging from numbers of seconds to perhaps minutes). If you're very lucky, you can spend the next five minutes inputing the keystrokes to save your document (but see below), and then reboot to get rid of the phantom; but if he's managed to get a sufficiently firm grasp on the machine, it will probably just lock up or bomb completely.

Note that word processors seem to be the phantom's favorite target, though some users have reported that he sometimes gnaws on Flash; perhaps any keyboard-intensive application is a candidate. The problem is definitely not limited to any one company's applications; Word Writer, Word Perfect, 1st Word+, and Flash users have all been bitten at one time or another. If (as kbad recently suggested) the phantom is due to bad programming practice rather than a bug in TOS, then a lot of major developers are breaking the same rule or rules, and it would sure make everyone's lives a lot easier if we could isolate them.

One thing I haven't seen mentioned in previous discussions of the phantom is that the slowdown is connected to mouse movement. (I

posted concerning this a few days ago, but I'm not sure the posting made it out.) Next time the phantom strikes, try moving the mouse slightly after each keypress. Here's the typical scenario when the phantom strikes me in Word Perfect:

1. The machine slows to a crawl; keystrokes and mouseclicks take effect only seconds after a key is pushed or button clicked.
2. I hit F7 ("Exit"). Nothing happens.
3. I move the mouse slightly. "Save file?" dialogue appears instantly.
4. I respond with "y". Nothing happens.
5. I move mouse slightly. File is instantly saved and "Exit?" dialogue appears.
6. I respond with "y". Nothing happens. Etc.

Maybe the fact that keystrokes take effect immediately when the mouse is moved suggests something that will help to ferret out the phantom. At the very least, moving the mouse may save you a few tense moments the next time he strikes. BBB

>Bob Bright <bright@ccu.umanitoba.ca>

Uh... Yeah! Actually, it does, and I don't even own an ST. (SO please:
if my idea is completely off base, sorry for the bandwidth. Please don't
bother with flames.)
I had a lockup problem not entirely dissimilar with one of my Amiga
systems a while ago, only the "fix" was to pop _any_ diskette out and back
in. The problem turned out to be not software, but a bad CIA chip (Complex
Interface Adaptor; chip that converted disk, serial, keyboard etc output
into something the processor could handle; i.e. an I/O chip) that was
sending noise on the signal lines. Replacing it fixed the problem.
So here's the question: could this be a similar situation, caused
by excessive RF interference or a bad run of chips? Somebody out there
who likes taking apart their ST systems might want to try improvising
with additional (and removing - see if it happens more) shielding.

I am pleasantly surprised already...you are the third response I
read regarding other's users group. I'm glad to hear that the situation
is reversed in your communities.

As to the user group meetings I went to that had massive piracy: I did
file a complaint with the FBI. They had me fill out a couple of forms,
and that was the last I heard.

1467. GNU-Emacs 18.55, reported problems (and solutions)

Newsgroup: comp.sys.atari.st
Date: 1990-02-08 20:40:03 UTC
From: roeder@sbsvax.cs.uni-sb.de
Message-ID: <2688@sbsvax.cs.uni-sb.de>
Source record: 243742

Now that GNU-Emacs 18.55 has finally appeared on comp.binaries.atari.st, I
think it's time to summarize some of the problems people had with the
installation.

1. missing termcap file

Although mentioned in the README, the /etc/termcap-file was missing
in the distribution. Sorry about that. I have posted a sample time
some time ago here in comp.sys.atari.st.

2. "termcap file not found"

Emacs looks for the termcap file as "\etc\termcap" (this means in the
directory termcap on the same drive where emacs was started) or it
looks at the place specified in the environment var TERMCAP. But it
expects the filename in unix-syntax.
A value of "\emacs\misc\termcap" IS WRONG (uses \ instead of /).
A value of "E:/lib/emacs/termcap.em" IS WRONG (uses E: for a drive
instead of /dev/E as suggested in README).
A value of "/dev/E/emacs/stuff/termcap" IS OK.

3. "terminal cannot position cursor"

Then you have possibly edited the file or used ascii-file transfer.
The file contains ^M at the end of the lines. For emacs, ^M is just a
char like any other. So the backslash intended to mask the end-of-line
in continuation lines only masks the carriage-return. The next ^J
(end-of-line) will end the current entry.
If you see no way to remove the carriage-returns, you can at least
concatenate all lines of an entry (until you can edit them with emacs).

4. incorrect display, missing characters

There was a bug in the stdio-library used to compile emacs. Therefore
you cannot use ^J for the 'do'-capability (cursor-down). Please use
'do=\EB' instead.

5. temacs complains about missing files with dashes in their names

This is a problem of some zoo-versions. For example the zoo compiled
with Turbo-C (and posted in comp.binaries.atari.st) converts '-' in
filenames to '_'. You have to rename the files (or use another zoo).

6. temacs is unable to find any lisp file

Temacs will not look in the current directory for lisp files until it
is dumped. It searches them in "../lisp". So please move the files
into a directory named lisp.

7. dumpfix says that the two xemacs versions have the same basepage

As mentioned in dumping.txt, you should create the dumps at DIFFERENT
LOCATIONS IN RAM. You can achieve this by adding another accessory or
calling a second shell.

8. what are the correct answers to dumpfix' questions ?

I don't know. If you get a problem with the dumped emacs and are not
sure wether this can be related to "incorrect answers" to the questions
of dumpfix, you can always try to reproduce the problem with the
initialized, but not dumped temacs (call "temacs -l loadup.el"). If
the problem is not there, you can for example switch the two first
parameters to dumpfix and try again.

9. emacs gets a bus-error (address-error, ...) after the initial screen

See my previous posting about the timeout-problem. Don't apply the
binary patches posted here some weeks ago. The problem was not so
easy than i thought after a first look (:-().

10. how can i swap the meanings of Backspace/Delete ?

Please see the regular discussions in comp.emacs and gnu.emacs on
this topic. The documentation for global-set-key might also help you
(press Help f global-set-key Return).

I think this should be enough for today. If you have more questions (but please
not "can you mail me parts xx-yy?" :-)), you can always send mail.

>reading the boot sector and getting the sector size from there. But are there
>risks in doing that?? Will that crash the system also?? Or does someone have a
>non-crashing version of dfree() that I can use?

You don't want to just call Dfree because 1) It will cause system failure with repeated use and 2) it is VERRRRRRRY SLOOOOOOW for even small sized media. You can do the same job yourself reliably and much faster. All the information you need to determine free space on the disk is contained in the disk boot sector and the FAT table, you just have to know how to piece it together. When making your own disk free calculations it is important to remember that the ST file system is based on clusters not on bytes. If you do it right, there is no danger in doing it yourself and significantly less danger than letting TOS do it.

Source record: 243711

Many people have been asking if ANYONE had gotten their PC-DITTO II
to work correctly...

A friend of mine received and played with his pc-ditto II for a week
with no luck... Installed, the board caused his MEGA2 to bomb!!

When he was finally able to get through to AG, they told him that his
BLITTER was conflicting with the board, and that if he saved the desktop
with BLITTER disabled, that would take care of it...

Besides some physical difficulties (like getting the board inside his MEGA2
which already had a hard drive inside it) that were kludgable...
He has gottn it to work.

The board is HUGE... about 5" by 7" !!!
and he connects it every time he wants to use it, because he has gotten too
used to the speed the BLITTER gives him. He has the PCD II board OUTSIDE
his computer, and has ribbon cables running too it!

But hey, it works fast, (MUCH FASTER THAN PC-DITTO I), and looks like
a reasonable clone... We didn't run speed tests, so can't give ya any
hard numbers...

1471. Re: Epson LQ800 driver for Mac

Newsgroup: comp.sys.atari.st
Date: 1990-02-08 21:17:36 UTC
From: kassover@control.crd.ge.com
Message-ID: <5163@crdgw1.crd.ge.com>
Source record: 243713

I am attempting to attach an Epson LQ1500 printer to a Mac Plus. My particular printer has a SERIAL interface board, which means Grapplers are useless, since the output end of same are all Centronics.

Furthermore, I believe that the LQ1500 (which is about 4 years old) and Imagewriters of the same vintage are, in fact, identical.

I have gotten so far as to connect the LQ1500 to the mac, use the chooser to select the IMAGEWRITER, and cause Word to print something. Nothing appears at the print head. By using an RS232 breakoutbox, I have detected that there are actually bits going down into the printer.

Furthermore, the printer works just fine when connected in the normal way to my VAX.

I have scanned through the multivolume work entitled something like "INSIDE THE MACINTOSH", which says that the default printer and modem port selections are 9600 baud, eight bit characters and TWO stop bits. Setting the printer to accept two stop bits is an experiment I will try, probably some time in the next week. I will also try to convince the local Epson representatives that there might be a driver I could just buy. (but I would rather not, at this point)

In the meantime I would appreciate any clues that could be supplied in this matter. I will post whatever works, if any.

Please reply by E-mail, since articles seem to evaporate very quickly around here (halflife seems to be 2 days)

Thanks again

I have had the pleasure of attending Atari club meetings in a couple of cities including the TAF (Toronto Atari Federation ...or similar name) in 1987 and agree with Richard. We all know piracy exists in the ST community but even if Rob saw the kind of thing he mentions in one place it does not mean ALL ST clubs are meant for this...I have no ulterior mtive in saying this as I do not even belong to any CLub or Association.....

Imran Anwar

|| Questions about TeX for the ST.
|| ------------------------------
||
|| I have seen that TeX is sometimes mentioned in this newsgroup. Does TeX really
|| exist for the Atari ST ? How much memory does it use, do I have to have a

YES! several implementations are available I use Ctex2.9

|| laserprinter, is it fully compatible with TeX on BIG computers, can I transfer

You can use EPSON or deskjet or ...

|| a DVI-file from the Atari to another computer and still wind up with a
|| beautifully TeX:ed text ? Where can I find TeX and is it public domain ?

Absolutely! Just make sure that you have the same (and complete)
font files. However the formatting is so fast it is often more
convienent to just reformat the *.tex files on the bigger
machine (this is what I usually do--- gets past the problem of
missing fonts).

TeX is sort-of-PD (copyrigted but free) complete packages can be
ftp'd from atari archives like terminator and cwru (best
package). You can also buy ($150?) a complete package from the
authors of a GERMAN ST port. Current Notes carries a
distribution for a few bucks ($6?) as well.

||
|| I would appriciate an answer to these quesTeXions and anything else that is
|| worth knowing about this subject...
||
|| Thanks in advance
|| Martin

IMHO TeX + postscript beats almost all the of the so-called
DTP's available commercially... and it's (almost)FREE!

I think it would be an unfair characterization of Atari Users' Groups if they were generally considered software piracy havens. To the contrary, my experience has been that Users' Groups have strongly opposed piracy. Dave Schreiber speaks the truth re. Toronto Atari Federation meetings. Piracy is not tolerated there. Similarly, pirates can not be found at MTST (Metro Toronto ST users group) meetings. The said group takes pride in operating a network of strictly 'non-pirate' BBSes in the Toronto area.

>Without good marketing, your product is dead. And Atari Corp has
>never had decent marketing and dsitribution here in the USA.

Sure, there is a great reason, and you hit it on the nose.
Atari has *NEVER* been any good at marketing in the U.S.
And they don't seem to be heading in the right direction yet either.
Atari is able to make decent to good products
inexpensively and they sell them where people appreciate that,
Europe mainly, and most other countries except the U.S. Marketing
here takes a lot of know how that Atari just doesn't have. Besides,
the cost that it takes to meet the FCC regulations in the U.S. just
doesn't seem to fit with Atari's "make 'em as cheap as possible"
policy. The end result: America doesn't get many computers from Atari.

You'll probably not believe me but there is a thing called Atari Computer Gmbh situated in Raunheim, West Germany. Turbo C/MAS/BUG are being sold by Borland GmbH, West Germany. So, what should be easier than for an Atari employee to get Turbo C via Atari West Germany? Besides, you can order Turbo C by mail, as far as I know. All you have to live with is the German documentation.

Greetings

It probably works like this: only registered user of a software package are entitled to updates. If you do not send in your registration card, you are not a registered user. Ergo: you don't get an update.

I don't think this has ANYTHING to do with a warranty.

Greetings,
Martin Boening

1486. Re: A better GIF viewer

Newsgroup: comp.sys.atari.st
Date: 1990-02-09 08:02:55 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <9002090802.AA05425@ucbvax.Berkeley.EDU>
Source record: 243728

Hello all,

Mickey Boyd recently asked about a better GIF picture viewer for the ST.
Some people replied, suggesting various programs that include GIF viewing
options.

There is a complete GIF viewing program to be found at Simtel20 (in MISC.GIF
or MSDOS.GIF or the like, can't remember). It's for PCs and clones, but it
includes complete source in Turbo C. I had thought of porting and enhancing
it, but couldn't, for lack of time.

Maybe someone will do the job.

I think that this is a very natural thing to do with stderr. IF we try
to suggest a good method, it should be possible to do all things that
you do with sterr on other OS's. If Atari makes a workings suggestion,
it will be surely incorporated in Gemini 1.2.

Some problems may arise with programs, that use Kbdvecs() to
install themselves and that forget to look at the newly-documented
status variable that tells wether the IKBD is busy sending a
'packet'. Changing the vector in the wrong moment would disturb
the BIOS definitively.
BTW: I had the 'phantom typist problem' when using older versions
(<3.14) of Wordplus.

Source record: 243731

Anyone really knowledgeable out there know if there are yet any
inexpensive samplers coming out with a spec. as follows:
1. 16 bit A/D/A conversion.
2. Driven by ST midi port
3. Sequencer to St midi port to sampler.
4. 8 RCA outputs
5. 500 dollars
6. Supports a database of sound files on an ST drive
The 8 bit just dont do the job.
Also i have heard about uniplayer - what is it??????
Also any floppy opticals coming out??????????
Sign me still waiting for solutions!!!!!!!!!!

```
More about Turbo-C 2.0

The newest information from Borland Germany (9.2.1990)
------------------------------------------------------

The NEW (after 1.1) features of the Turbo-C-Compiler/Linker are:
- the compiler supports the Turbo-Debugger (Source-Level-Debugger)
- the linker support identifier longer than 8 characters
- new books: a manual-part and a reference-part
- and other "small" changes ...

The features of the Turbo-Debugger are:
- Debugger with GEM surface
- you can debug GEM-applications without any restrictions
- debugging at C-source-level or assembler-level
- showing data and data structures in C-Syntax
- more than 7 windows
- refresh background windows
- supports MC680x0 and MC68881/MC68882
- debug functions:
. single step (step)
. single step with procedures as one step (next)
. breakpoints with expression, by changing variables, using memory allocation
and depend on pass-counts
. watch-variables, show every time
. animate-function: step tracing
. memory manipulation

new release (18) for MAS, but no update now!

TC2.0 will be finished end of February or begin of March.
At the latest 22. March (CeBit). 1990 i think, but i havn't ask !
================================

The update costs:
-----------------
TC1.0 -> TC2.0 : 111.72 108.--
TC1.0 -> TC2.0 & TD & MAS : 313.50 285.--
TC1.0 & BUG & MAS -> TC2.0 & TD & MAS : 214.32 198.--

TC1.0 -> TC2.0 : 88.92 88.--

1492. Piracy and Upgrades

Newsgroup: comp.sys.atari.st
Date: 1990-02-09 11:54:38 UTC
From: pritchaj@agnes.acc.stolaf.edu
Message-ID: <11222@thor.acc.stolaf.edu>
Source record: 243733

O.K. so I am whining....

I have had my 1040st system for a couple years now and still like it. One of the things that was attractive to me about the ST was the inexpensive yet good quality software that was available. But since I purchased my software a year or two ago, upgrades have come out, and I would like to follow-up on those upgrades. I have had 4 experiences as of late with upgrades:
WordPerfect
SuperBase Personal 2 --> Professional
Publishing Partner --> PageStream
UIS II --> UIS III
WordPerfect and UIS were fairly easy to upgrade, and fairly inexpensive. The documentation addendum to WP was a little to be desired, but I can live with that. UIS sent a manual (UIS I and II only had a couple sheets of paper), which was really nice to have.

I just orderred my PageStream upgrade, reluctantly. I realize that they made a major effort to rewrite the product, but what about loyalty to those of us who buy and register? I have not yet decided to go with the new SuperBase. From what I have heard (nothing official, yet), the upgrade is $200.00. Again, I realize this is a whole new package, but what about a little loyalty? Superbase even places a little propaganda in their packages about the normal progression throught their packages, showing how you go from one to the next. Does this bother anyone else? Any other experiences?

1493. ATW info and status

Newsgroup: comp.sys.atari.st
Date: 1990-02-09 13:09:01 UTC
From: rochman@ECF.TORONTO.EDU
Message-ID: <90Feb9.080912est.20744@ecf.toronto.edu>
Source record: 243734

I requested information about the ATW from the Atari Canada head office here in Toronto, and they were kind enough to mail me a 4-page spec sheet. If I see enough interest, I can condense this info and post it in a note, but I'd already read most of it myself in various magazines.

The most interesting bit is at the end, where it says stuff about an initial 50 development systems around the world (for software developers to produce the bare developers environment), followed by a limited pre-production release of "several hundred" systems during June 1989. While the pre-production release wasm
not to be restricted, (the spec sheet is from March/April '89), companies producing commercial applications were to be given preference. It adds that full scale production "is expected to start during July 1989", and that the ATW is expected to retail (sans monitor) for less than $10,000 (Canadian Dollars, March '89).

Now for the "live scoop": I have seen and used one in a commercial environment!! At SEVERAL Toronto-area tourist attractions, there are booths run by KODAK where you can have your picture taken (digitized), and then printed (in full colour!) on a T-shirt, or post card, or whatever. The interesting part is that they do all the digital bit-twiddling you want (eg: putting your face on George Bush's body in a White House press photo, etc...), and the machine they use for this is an ATW!!!

Needless to say, I stayed at the stupid booth at Ontario Place (a local tourist trap) for HOURS, drooling openly. The graphics can't even be described. Workstation users will know what I mean, others can't even imagine. A $15-20,000 ATW setup, working with the KODAK color digitizing cameras and photo-quality colour printers, is a media magician's fantasy.

I may even get a summer job at the rotten place, just to get my hot little hands on that magnificent piece of hardware. Tales of a silicon junkie... But I looooooove that machine.

I highly recommend the Practical Solutions cordless mouse, that is if you have the 100 bucks that it costs. It's resolution is twice that of the atari mouse, and it moves so much smoother. The buttons on it are more responsive too. The only problem I've had with it is with the batteries -- I use the mouse so much that I've run them down in 3 weeks, they should however last about 3 months from normal use.

* CANADIAN ATARI USERS CONVENTION
---------------------------------> PRESS RELEASE

The Toronto Atari Federation, sponsor of the upcoming SECOND CANADIAN ATARI USERS' CONVENTION, is a non-profit users' group whose sole aim is to serve the Atari community in Canada. As a user group, we understand fully how attendance at computer shows can amount to a major item in the yearly budget. However, we feel strongly that user groups are key players in the world of Atari. Therefore, we are offering a special, reduced rental rate for booths to all Atari user groups. As an Atari user group, your fee will be 57% off the regular Exhibitor's Rate. That is, you pay only $125.00 Canadian.

The SECOND CANADIAN ATARI USERS' CONVENTION will certainly be the major Atari event of the year. The previous Convention was a runaway success, and we are determined to outdo ourselves in 1990. We hope that you will want to share in the excitement with us. This special offer for user groups is subject to the availability of booths. Only one booth per user group at this special price. To ensure that your user group does not miss out, please respond as soon as possible.

* Please note that booths rented at the special reduced rate for user groups may not, in every instance, be a standard 10' x 10' due to the shape of the room.

Dear Exhibitor

The Toronto Atari Federation is pleased to announce an event of special interest to Atari dealers and user groups. The SECOND CANADIAN ATARI USERS' CONVENTION will be held on April 1, 1990 at the Airport Hilton Hotel, 5875 Airport Rd. Mississauga, Ontario.

This special event comes as a direct result of the demand, both from dealers and users, which followed the highly successful "First Canadian Atari Users' Convention," held in November, 1988. That show exceeded everybody's expectations, drawing a crowd of over 2,000 attendees in just 5 hours, generating a great deal of business for participating retailers, receiving very favourable reviews in magazines such as Antic, STart and Computer Shopper, and attracting a surprisingly large percentage of attendees from outside the Toronto area and from the United States.

A conservative estimate of attendance for the upcoming show is 3,000 attendees, making this event the largest gathering of Atari users ever in Canada. Dealers can look forward to immediate contact with a very large segment of the Atari market. For dealers this is the premium segment of the market - attendees are eager, enthusiastic and ready to make significant hardware and software purchases. Users will be drawn by a very wide variety of exhibitors and other attractions.

Exhibitors' costs will be kept as low as possible, since we are a non-profit users' group whose only aim is to serve the Atari community in Canada. Admission prices will also be kept low in order to attract the largest crowd possible.

The SECOND CANADIAN ATARI USERS' CONVENTION will feature, retailers, displays by software developers and hardware manufacturers, guest speakers conducting a day-long series of seminars in our lecture rooms, and a major exhibition by Atari Canada. The Airport Hilton Hotel is an excellent hotel with the highest reputation and first-rate convention facilities, conveniently located on the Toronto Airport Strip near several major expressways and right on the public transit system. Room rates will be specially discounted for everyone connected with the Convention.

Our promotion of the Convention will be even more dynamic and professional than in 1988, supported by a much larger budget. The advertising campaign will include major newspaper advertisements, press releases, posters, pamphlets, and a BBS campaign across North America.

If you are interested in obtaining more information on how to be an exhibitor at Canada's Atari event of the Year, please feel free to call one of the phone numbers listed below or leave mail on GEnie to M.SEARL1. Booths will measure 10'x10' and will be curtained on three sides; one 8' table, draped. One Hydro outlet is included in the booth price. Power bars and extension cords are the responsibility of the exhibitor. Extra tables are also available for a nominal charge. We expect all booths to be sold well before the show date. To confirm your participation in the Second Canadian Atari Users' Convention, please Respond as soon as possible. For inquiries, do not hesitate to call me at (416) 477-2085 or Mike Searl at (416) 245-5543. A FAX number will be provided from Feb 1st to April 1st for your convenience. The number will be (416) 245-5089.

Yours truly, Paul Collard, Convention Coordinator
The Canadian Atari Users Convention

Press Information For Immediate Release

The Second CANADIAN ATARI USERS' CONVENTION
==========

The largest gathering ever of Atari computer users in Canada is expected at the upcoming Second Canadian Atari Users' Convention to be held at the Airport Hilton Hotel On April 1, 1990 from 10am to 6pm. Sponsored by the Toronto Atari Federation, one of the largest computer user groups

in North America, the Convention will offer the public a once-a-year opportunity to see what is new and exciting in the world of Atari. There will be exhibits, seminars and demonstrations by a wide variety of retailers, guest speakers, user groups from Canada and the U.S., software developers and hardware manufacturers. "Show Special" prices offered by retailers, Public Domain software from user groups and reduced room rates at the Airport Hilton ensure bargains for everyone. A special feature will be a major exhibition by Atari Canada, where a full range of their product line, from 8-bit computers and game machines, through 1040ST's, Mega 2's, Mega 4's and PC clones will be on display. One of the biggest draws is sure to be the recently released and widely praised Atari Portfolio, an MS-DOS compatible computer which fits in the inner pocket of a business suit and the latest new Atari STE and STacy.

Other highlights include new products, several from Europe, which enable the ST line to emulate IBM and Macintosh machines more quickly and more easily than ever. The Second Canadian Atari Users Convention is being held at the Airport Hilton Hotel, located on Toronto Airport Strip, 5875 Airport Rd., Mississauga, Ontario.

For more information contact our Public Info-Line at (416) 425-5357, or the TAF On-Line BBS at (416) 235-0318

> They give all user's groups a bad name.
>
> ---
> Stephen Goldstein steveg@saic.com

The Phoenix Atari ST club is dedicated to helping our members use legitimately purchased software. We, too, do not allow pirating of software. Our PHASST sponsored bbs has a 40 meg drive with ONLY PD software. We do not allow piracy.

Our Agenda for Staurday's meeting includes:

15 minutes for PHAST Club business
Dave Thorenson gives a demo of a GEM Desktop replacement program
that he is writing. A first for the NAtion!! First time his program
has been demoed!!
Dave Thorenson gives a demo of his favorite game PowerDrome
15 minute break
15 minute Question & Answer period
Demo of Pratical Solution's Video Key for our 1040ST. Pratical Solutions
has an offer out where ST Clubs can get free Pratical Solutions products
if they are demoed for the club, and reviewed in the club newsletter.
Another demo, time allowing, of a game.

So, we don't have time for people to sit and pirate software.
All, in all, I think that it is a good agenda.

Rich Covert, President PHAST

Stephen, while I have noticed the same problems in PgS 1.8,I am nonethelss very pleased with PgS 1.8. For example, I have owned 2 laser printers in the last 2 years, the SLM804, and now the Panasonic KXP4450 Laser Partner. One thing that I enjoyed doing with my old dot matrix printer was printing out labels for floppies. I used an old program called "ACTION" (circa 1986!!) with my previous dot matrix printer. But when I got my first laser printer I couldn't use it it any longer. Finally, AVERY has come out with a aser printer label for 3.5" floppies. There are 9 labels for 8.5"x11" page, each label being 2.75" square.

Well, I sat down with PgS 1.8, and in a couple of hours learning made some forms for the AVERY labels. Andd they printed great!! I was even able to rotate the text 180 degrees to place on the spine and the back of the floppy. I made a bunch of labels for some pd disks for the PHAST Club withg PgS 1.8.

so, while PgS 1.8 may still have some bugs, it works very well for me, and I was able to learn to use some of its neat features very quickly.

Calamus, on the other hand, is still sitting on my shelf. I have yet to understand how to use its text editor, and its icons are very confusing.

So, I like PgS 1.8, and I even wrote a letter to Softlogik congratulating them on the 1.8 release.

1499. Wordperfect problems

Newsgroup: comp.sys.atari.st
Date: 1990-02-09 16:10:48 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <2170@calvin.cs.mcgill.ca>
Source record: 243740

I have a rather odd problem with this new version of WP I just got through the mail yesterday.

If I run it directly from floppy, it works fine, but if I boot from hard disk and run it, the F5-List files doesn't work very well. It displays ONLY folders, but no files, so I can't see what is on my disk.

And I tried disabling all mem-res programs, and I also tried running the floppy version instead of the one installed on my HD, [after booting the HD] to see if I what I installed on the HD is bad or if it is universal, and I get the same problem.

Anyone else experience this? Is there a fix for it?

>I am attempting to attach an Epson LQ1500 printer to a Mac Plus.
>My particular printer has a SERIAL interface board, which means
>Grapplers are useless, since the output end of same are all
>Centronics.
>

True.. grappler uses roms inside the cable/box.. and it
must be hooked up to mac type ports etc...

besides.. grappler is $200!

Anyway... i ended up buying the Epson LQ Software pack
from the local store.... $60... though others have seen
it for $45.... it comes with a cable.. i left that in the
box.. kept my LQ800 hooked to the parallel port...
i flipped a few dip switches... and installed the driver...
i didn't follow the directions in the manual as they
involved about 135 swaps of the floppy.... actually, i
DID follow the instructions the first time... but because
the installer didn't recognize my drive.. it defaulted to
trying to set up the boot disk on a floppy.. with only
ONE Disk Drive... this meant lots of swaps just for the
damn System to do its job... after 135 swaps.. it
didn't create a proper disk.. so i decided to copy the
files ONTO my drive FIRST, then install the drive there...

The driver comes with System 6.0.2 .. it reported that
my System 6.0.3 wasn't desireable... so i had to do the
usual.. boot off a floppy etc.. create a new system
folder in a different partition (fortunately i have several
partitions) and install the Espon driver in the new folder
with 6.0.2 (which doesn't work with sound/GCR by the way)..
(as far as i can tell). The software installed in less than
a minute this way.... I then added to this new system folder
all the stuff i had in my original system 6.0.3 folder...
I don't know exactly the differences between 6.0.2 and 6.0.3,
except that David told me sound doesn't/might-not (?) work
with 6.0.2/GCR... i had sound working with 6.0.3 ...
Anyway, i spent 3 hours trying to make contacts with Espon
in california and with 3 local epson dealers... no one
had any comments to make regarding the driver working with
6.0.3 .. as a matter of fact.. most people i talked with
didn't know the product they were selling....

I understand this is rather typical with Epson.. trying to
get support is pulling teeth...

Otherwise.. i have had an easy time printing from
WriteNow, Hypercard and from Canvas - an incredible object oriented
slash paint program... that keeps my wife between me and my
ol' ST....

I hear it, but I want the facts. Where do you get it and what does it need to run (especially how much memory - 1meg,2,2.5,or the whole 4megs).
thanks
Bob Pegram (pegram@griffin.uvm-gen.uvm.edu)

P.S. I know I posted needlessly on the Magnavox monitor too, but keep it down to a dull roar guys (fist fights outside the net). Email is the best way to do your heated name calling. RBPIII

> There have been some comments recently about potential damage resulting from
> the use of screen savers that change the screen to all black. Could someone
> please explain this? I thought the idea of a screen saver was to preserve

The problem is how all black is obtained. The all black screen saver
selects 'external sync' for the video.
(An artifact of trying to work with a GENLOCK). Since
there is no sync coming in on external, the screen goes blank. The problem
is that the monitor expected sync pulses to keep its flyback oscillator
in time.

If a monitor tends to free run at a frequency too far removed from the missing
sync, the fly-back and the driver chips may overload and overheat. Oscillators
are really strange things.

Also, with no sync, their is really no output signal (video information) either.
This can cause the bias on the video amplifiers to get to a point where, again,
they can overheat.

My old Mono, seems not to care about all of this.
My new Mono, hasn't complained (died) yet, but Atari did post a warning to
look out.
My old color, also seems not to care, but I don't run it often, or blank it
for long times.

>And they don't seem to be heading in the right direction yet either.
>Atari is able to make decent to good products
>inexpensively and they sell them where people appreciate that,
>Europe mainly, and most other countries except the U.S. Marketing

I think there is a misunderstanding here. HOw possible is
it for someone in the US to even have the chance to "appreciate"
the ST if they have never been "informed" or made aware
that the machines even exist!

>here takes a lot of know how that Atari just doesn't have. Besides,

I think the "know-how" is there... it's just a matter of "choice"
and taking a risk. Atari obviously doesn't believe their company
and products are competitive with Apple and Commodore and so on..
otherwise they would clearly be in the ring together... when
a company doesn't believe in their own product.. it's hard
for consumers to.

>the cost that it takes to meet the FCC regulations in the U.S. just
>doesn't seem to fit with Atari's "make 'em as cheap as possible"

Have you checked out the cost of a MacPlus lately...?
Every product goes through the FCC test... or is there a
conspiracy against ATARI..?

I used to tell my students that they were far better off
buying an ST than putting cash into a Mac. I caught myself
last night when a student was going out the door...
I couldn't HONESTLY tell them this anymore.

>policy. The end result: America doesn't get many computers from Atari.
>
>--
>Joachim

And many who own ATARI's are selling them and buying into other
systems.

Here are my two cents:
What if the user wants to redirect handle 2 stderr to the serial port (AUX:)?
Since this is the default assignment for this handle it will be difficult to
manage this case too.
I had two applications for this. Some time ago i wanted to debug a full screen
editor (not emacs :-) and have sent the debug output to a PC clone. I needed
this output while i was testing the program, not later. Therefore i could not
use a file. The second application needs to redirect all standard handles
(stdin, stdout, stderr). It's a program to run eg. games in a mailbox (for
example nethack). Then stderr IS a terminal, but not the console. And the
mailbox user will not like to play on the console screen (unless he/she is
clear-sighted :-) or sitting before the console).

> questions->dyer@math.lsa.umich.edu

We moved all of the stuff archived at math.lsa.umich.edu to terminator a long time ago. There's no longer any ST stuff archived on euterpe.

The stuff on ummts is basically a copy of terminator's archive, but older, and totally unorganized. So it goes. Terminator is the best bet, overall.

[Dale's suggestion was for startup code to do something like
if (isatty(2)) Fforce(2, -1).]

How about this suggestion: if all programmers who use the Atari extended argument passing scheme (ARGV=, etc.) also agree that handle 2 should be stderr, then startup code could do:
if (*argv[0] == 0 && isatty(2)) Fforce(2, -1).
(This assumes that argv[0] is an empty string if it isn't available, as specified by the ANSI standard). This way, ARGV compatible shells can redirect stderr to anything at all; non-ARGV compatible shells can redirect stderr to a file; and programs still correctly re-direct handle 2 when run from the desktop.

(Alex Leavens) writes:

(stuff deleted)

> > > >
Ok, but which program do you suggest? The system-disk you get
when you buy an ATARI harddisk in Germany contains a program
from 'Application Systems Heidelberg' (HDU V1.05), but I'm not
very happy about it. It terminates the backup-process if it detects
a write-error on the current backup-disk - and you can start again.
The same problem occurs, if you try to restore a backup and one of the
disks has a read-error. But if you need a compression program,
saves you only 10 or 20%, you could use it ... (I would
suggest ARC or Zoo for this purpose).
So, if you know a reliable, fast, cheap (PD or shareware preferred)
harddisk backup program, would you send me a message?

Thanks in advance,
Oliver

Hello,

I am currently writing a game in assembly that I would like to add some digitized sound to, but I have yet to purchase a sound digitizer. I have heard of digisound, digisound professional, replay4, and the ST sound digitizer but I don't know which is better or worth the cost. There may be others that I left out. I would appreciate it if anyone who knows which ST sound digitizer is the best value for the dollar would send me the info.

Thank you,

Guy :-)

Unfortunately, the user group here in Rhode Island is a front for
piracy (or it was less than a year ago, its probably still the same).
This is the experience that Rob is probably coming from since we are both
here in little RI.
The user group slowly was turned into a piracy place by the president
who brought his friends in and in some weird way took it over. He was
never challenged basically because the decent people felt there was
no hope. These new people were very apathetic and trying to get them
to help organize things was useless. I did give a couple of presentations
and tried to help out but the membership slowly died and everyone started
to care more about the latest cracked game from Europe shown by the
president than a nice discusion and demo on different forms of video
on the ST. Most of us gave up.
No pirating was done at the meeting but it was all done after the meetings
at peoples houses and there was often a cover charge.

I'm really, really glad that there are some good user groups out there
and I wish them the best of luck. The net is my only user group.

Disclamer: These are my opinions alone from experience seen and a few that
I have heard about.

I used to belong to a users group in this area (Santa Rosa, CA) and there was no piracy allowed there either.

However, drifting a little further, I have some questions about UGs.

Specifically, how much does your UG charge for PD disks? This group would charge $5 for members and $10 for non-members to buy a PD disk.

Is this typical? Mail order disks can cost this much. I would think that UGs would benifit the user a little more as far as PD prices are concerned.

The best package I am aware of is PAF from the LDS church. Not only
is it very powerful, but it has a excellent manual, and is CHEAP!!

PAF may be ordered from:

Salt Lake Distribution Center
1999 West 1700 South
Salt Lake City, UT 84104

1-800-537-5950 (credit card orders)

Price is $35.00 including shipping and handling

PAF is available in Macintosh and MSDOS (both 3.5" and 5.25" formats)
Specify disk size when ordering.

The manual for this package is excellent. However, if you have any
questions there are phone numbers in the front of the manual to call,
or you could look up the local Family History Library (Center) in your
phone book under Church of Jesus Christ of Latter-day Saints. If they
are anything like the center here (Las Vegas), the volunteers there
will know of people who can answer just about any question you can
think of.

If you have any more questions, or need more help in acquiring the
package please feel free to contact me again and I will help you in
any way I can.

1518. PC Speed

Newsgroup: comp.sys.atari.st
Date: 1990-02-10 04:47:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb9.235128est.57802@ugw.utcs.utoronto.ca>
Source record: 243662

Even though I paid for PC Ditto II in Sept 89, I still have not rec'd it. I got so tired of waiting that I bought PC Speed. After installing it the other day, I post the following message on our local BBS.

Last night, I installed the PC Speed board that I showed to users at the meeting on Tuesday. The installation was very easy in a Mega; I just had to solder a 64 pin socket on top of the 68000.

After I plugged the board into the socket, I booted the Mega and ran PC_INSTL.PRG. I set up the screen as an Olivetti (640x400) instead of either Hercules or CGA to get the same screen layout as the default ST screen. I then ran PC_SPEED.PRG, and, when asked, supplied MS DOS.

The NORTON SI was 4.0. I tested out dBASEIII Plus and Word Perfect - no problems at all (except for the fact they are PC applications which means they do not come up to the level of Mac or ST software's user friendliness).

At a future user's group meeting, I will show my Mega running as an ST, as a Mac (runs 20% faster than a Mac Plus) and a PC (runs at the speed of a Turbo XT). How's that for compatibility. If I had the cash, I would install a 16 MHz 68000 and run the ST at > 2x the speed of a Mac. I could also get the German 386SX/387 board and run the ST like a Compaq 386 !!!

Other facts about PC_SPEED.

(i) multi-meg STs can use the extra RAM as extended memory (my NORTON SI says I have 960k extended memory with the Mega 2).

(ii) extra RAM can be used as a RAM disk with a supplied .SYS file.

(iii) the 68881 math co-processor will be used to emulate an 8087 so that a single co-processor can be used for Mac, ST and PC modes.

Since that posting, I formatted drive C: with MS DOS but I could not get PC Speed to boot from hard disk. Was that because I reran HINSTALL to have the ST boot from C: as well?

RE: Epson Emulator for SLM804

One Germam MIDI program called "Master Score" includes this Epson emulator with the Program disk since early 1989. I have tried to use it to print documents from other programs such as 1st Word Plus, Word Writer II without success.

We got the complete version with few fonts since June 1989 (6 or 7 months back) It work fine. I can print graphics in the 1st Word plus document now. There is no graphic in Diablo Eemulator. As we do not have the FCC req here, we always get the new Atari sooner than many countries. The 1040STe has been availabled since January 1990 at the same price as the older 1040STFM. I got my 1st Atari 520ST since May 1985 which I beleived that that was log before it was available in England.

BTW I would love to have an Epson emulator software for the HP LaserJet IIP.
I can't print Degas Pics unless I ported it to TimesWork DTP or Page Stream.
Would any expert with very kind soul care enough to write up one?

RE; Hard Disk

Hi Dave,
I ask you here because your answer will surely benefit other netter too. Getting tired of the faan noise from the MEGAFILE 60. Yes I have tried putting 10K Ohm 5 Watt resister to reduced the current and lower the noise down for quite some time until I lock-up the MicroScience. Now the fan is back to full blaze with the SEAGATE 277-1 rattering instead of Dead MicroScience.

I just obtain a 100MB CONNER SCSI 3.5" and only 1"Thk HD, an ICD host adapter. I planned to install it inside the MEGA casing by bolted the Drive and the card to the under side of the RF Shield. I saw a picture of Third Coast Interna l drive for MEGA the drive is fixed upside down. Will these shorten the life of the Hard Disk. I could fabricate 4 L shape brackets if necessary to turn it right side up but won't look as neat. Another question is I still not quite clear how to format HD to make it recognize by Macintosh after tapping SCSI out to DB-25 for MAC. You did mentioned that the HD has to be format with Supra

RE: Hard disk
Hi Dave,
Sorry, my quick finger accidentally press the PF5 key before I finish and check the typing error. Here is the continuation:

You did mentioned in your beige color Newsletter as we as in the Spectre GCR manual that in order to make the hard disk readable by Maiintosh. It has to be formatted with suitable HD formatter and you suggested using Supra HD formatter Do you mean the Supra Formatter for Macintosh or Supra HD formatter for Atari?

I have the Supra Formatter for Atari and Unimax Storarere for Macinto, Can I use any of these program? Thanks, Suthipa.

In

Message-ID: In <1990Feb8.160136.12703@Solbourne.COM>
Date: 8 Feb 90 16:01:36 GMT

stan!katmandu!stevem@boulder.colorado.edu (Stephen Matson) jumps
on AMEIJ@vax.oxford.ac.UK (Jan Ameij)

because the latter allegedly jumped on the collective group of ignorant European
netters, that is to say those European users which are ignorant of network
manners or more specifically of listerver manners and of which there seem
to be just as sufficient a number on this side, thank you very much.

> I'm the one that got a good laugh at your semi-hostile tone.

Hmm. Doesn't look to me like this one is particularly friendly, does it?

> This group is one of the worst for intolerance.

No kidding!

Actually although Jan's note is basically common sense and I'd even say
helpful, the tone does get spoiled a bit at the end

>> If not, a) ask someone who knows about these things and b) ask yourself
>> if you are really suited to this form of communication. Perhaps it would be
>> better to learn a little more first?

Observe that the note would have been almost perfect if the AND between (a)
and (b) was replaced by an OR... (a) ask somebody OR (b) ask yourself if etc...
Notice the "subtle" change? ("You can redeem yourself, if only...")
The mysteries of Boolean Algebra and/or (oh no!) logic at work.
(Hey, while I'm at it, how do you apply Metaphysics?... That was how you apply
Boolean Algebra, but Metaphysics?...)

In any case, if I was just starting to get used to networks and stuff and I had
forgotten say how to unsuscribe, I'd think such a note was heaven sent.
I mean, not only does it irritate the whole list and it's embarrassing (very,
I would be anyhow) but it EVEN DOESN'T WORK... Clearly people who do that wish
they didn't... So anyway, I don't think that anyone would have to go into
psychotherapy, or be traumatized for the rest of their life for reading Jan's
note EVEN if they considered themselves part of those who are NOT suited to
electronic communication, not until they learned some more anyway.

> a) Ask yourself if your really suited to communicating. or b) Perhaps
> it would be better to learn a little manners first.

Yeah right. You see, the difference is that Jan was teasing or being sarcastic or whatever, towards an undefined group, an abstraction, into anyone is free to identify themselves or not, whereas you were firing up his own personal ass. My, Stephen, I think you were the cranky one that morning,

Jacob

Moshe Braner's Idle 1.2 does not blank the screen by removing signals from the monitor. It displays a black screen using the memory below the default video memory. If that area is in use, it just does reverse video on the screen. It will NOT hurt your monitor. I've used it for years and I've examined the code in detail. Moshe writes good code!

>>Thank you

>The best package I am aware of is PAF from the LDS church. Not only
>is it very powerful, but it has a excellent manual, and is CHEAP!!

PAF is supposed to be quite good, but the ultimate genealogy program
is Roots III, from CommSoft, 2257 Old Middlefield Way, Mountain View,
CA 94043, phone (800)-327-6687, BBS (415)-967-6730. Its ease of data
entry, reporting, and print formatting surpass anything else which is
available. You just can't appreciate the difference until you see it
for yourself. Call the toll-free number and request their product
literature. The bad news is twofold: It's only available for MS-DOS
(written in assembler), and it costs a couple of hundred dollars. The
good news is that it is supposed to run just fine under pc-Ditto.

i agree completely. my biggest complaint with all the wysiwyg type programs
is "what you see is ALL you get" (ie. no extensibility, very limited
customization possibilities, and too much clickity-clacking with the
mouse to do anything useful.).

incidently, a slightly improved version of CTeX is now available on
dsrgsun.ces.cwru.edu in pub/StTeX. by popular request i have put 1M,
2M, and 4M binaries there (please dont mix their .fmt files. the 4M
binary will consume all of your 4Megs, so you may consider the 2M
binary instead). for a brief period there was a buggy version there.
if you have one of these, (\today will give you a crazy date. (thanks ed P))
please grab a fresh binary (and delete time.c and time.h from the
CTeX source directory). the new binaries will undump more reliably.

1541. Hard Drive Problem

Newsgroup: comp.sys.atari.st
Date: 1990-02-10 23:14:32 UTC
From: brazil@pawl.rpi.edu
Message-ID: <QZ7$-+@rpi.edu>
Source record: 243685

I've got a problem I hope someone can help me with. I've just recently upgraded my HD, and now I'm having some problems.

My old hard drive is a pre-production SH-204. It contains an NEC 20 meg mechanism, an Adaptatec 4000A controller, and an Atari host adaptor, along with the power supply.

I purchased a Priam V185 mechanism to replace the NEC to bring the system up to 62 megs. I also bought a new power supply, since the Atari one is not enough to spin the Priam.

I removed the NEC mechanism, and connected the Priam. Big cable to big connector between the drive and the Adaptatec, and little cable on the drive to the first little connector on the Adaptatec, J0. I think they were in the right direction, although Atari does not use the block&slot method of polarizing cables (I wonder why?). I didn't adjust anything on any of the boards.

I then booted the system with HDX 3.01 to format the drive. HDX reported that the "Selected drive is not responding. Check cables or inser a disk." I tried this a couple of times, and it just didn't work.

Next, I tried formatting with the 8/12/87 version of ICD's utilities, from before they only worked with ICD host adaptors. It also would not work, saying something like "Sense code: 0".

On a whim, I decided to power everything down and switch the little cable from the drive to the other connector on the Adaptatec, J1. I then tried again to format using HDX. It still didn't work. I tried ICDFMT again. No luck. So, I tried changing the LUN setting in ICDFMT from 0 to 1. This time, it formatted. It also verified all the sectors and said that everything was OK. I tried reformatting it just to make sure. ICDFMT recognized that the drive was already formatted by giving a "Warning: do you really want to erase all the data" type message.

When I exited ICDFMT and tried to install the drives to access them, it (TOS) said that they did not exist. I tried rebooting and installing the drives, and it still didn't work.

Anyone have any ideas on what the problem might be? I'd prefer to get it to work with HDX, since Atari still supports it, and I need partitions bigger than 16 megs. Help Please!!

It requires at least 2 megs -- this fact as already been posted to the net
nearly every day, but the real question is WHY does it require SO MUCH memory?!
I'd really like an answer to that question.

> From what I know, you can't use HD on the ST. The controller chip
>can't handle it. Just be glad it works in 720k mode. :^)

Well, you can, if you hack the hardware.

Here we go again:

The trick is to double the clock frequency of the controller chip, so it
will talk twice as fast to the drive: the bit stream has "high-density"
format.
A clock of 16 MHz is well behind specification (the WD1772 is rated to
run at up to 10 MHz), but it will work most of the time.

The hack consists of two parts: hardware and software and works with
high density drives only!
Now: the hardware.

The clock pin of the WD1772 is pin 18. It is normally hooked to the 8
MHz clock.
Cut this pin and connect it to the output of a simple circurit. feed the
two inputs of this simple circurit with 8 MHz and 16 MHz clocks (16 MHz
can be get at SHIFTER pin 39).
The "simple circurit" mentioned above could be a simple, manual switch.
Now You are able to select two clock frequencies and therfore two
"modes" for the controller chip: double density and high density.

The simple circurit could also be a multiplexer (74LS157, I think)
controlled by the "I detected a HD-disk in me"-output of the floppy
drive (the TEAC FD 235 HFN provides this outout on pin 2 if a jumper is
set; the 235 HFN has a second jumper that enables internal detection of
HD disks: this must be set, too).
With the MUX, a disk inserted will select the appropriate mode of
operation automatically.

Do not worry about two drives in different modes: when copying from one
drive to the other, the clock rate will be switched once to twice a
second. This will not trouble the controller (remember the clock to be
in the range of Megahertz...).
If you want to connect one HD drive and one DD drive, you'll need two
more TTL gates (one 74LS00 will do) to make sure, the controller is in
DD mode for the DD only drive: invert the HD-detected-output (it is LOW
for DD before, HIGH for DD behind the inverter) and feed it into a NAND
together with drive select for the DD drive. Let a HIGH output of the
NAND select DD-clock (8 MHz). Now "not-HD-detected OR DD-drive-select"

will select DD mode, right?

With two HD drives, there is no problem at all :-)

Now for the software:

The controller uses its clock as base for all timings.
The pulse width and time between pulses for the step line are controller controlled.
To make it short: with the doubled clock the controller will try to make the head step twice as fast: he will send a step pulse every 1.5 milliseconds if set to 3 milliseconds (which is TOS standard).
Just set the step rate to 6 milliseconds to make the controller step 3 milliseconds in HD mode (well, the 6 milliseconds steps in DD mode will slow down floppy operation a bit, but not that much. Not stepping, reading and writing takes the time!).

How to set the step rate?
Well, there is a documented TOS variable for the step rate at 0x440 called seekrate.
The step rate in this variable will be used by the BIOS after a call of the routine, pointed to by "hdv_init" (the hdv_init routine seems to initialize the BIOS parameter blocks for the floppies). The pointer to hdv_init can be found at 0x46A (this is a supported TOS variable, too).
Look at the MWC-Assembler source below.

The second thing is to get a formatter that will format 18 sectors per track. HYPERFORMAT by Claus Brodt is such a thing, but a simple formatter hacked from the example in the Mark Williams C Lexicon did the same. It's included below.

For help try to write to hase@hase_1.mbx.sub.org, but it'll probably bounce; our mail service is fading fast...
I'll try to reply to anything, I finally get.

I am about to do the big screen (cheap-o german) modification
for my 1040. I have 2 questions...

1) Has anyone done it and have comments?
2) Is overscn2.arc at terminator the latest in the overscan
software? I checked panarthea and they only have
a version way back in volume5 binaries and volume 2
binaries...

Thanks for any info. It is much appreciated.

Well, the latest problem I've had with Word Perfect ST has to do with indenting. It just isn't indenting a paragraph properly, unless I make the settings and then go in and backspace a few times - suddenly it works. Second, I put in a few extra tab settings and a minute later find that they have been reset to default settings. Sometimes this happens immediately after tabbing once, sometimes a little later. I can't get my settings to stick. Since I am in the middle of formatting a rather long document, these idiosyncracies are driving me absolutely bananas.

>Spectre, but no change.

On pages 55-56 of the Spectre GCR manual David Small points out that the keypad keys do not generate an "extended MAC keypad 0-9", but are mapped to send the codes for the typewriter keys. For MAC software that cares, it doesn't see the ST keypad as a MAC keypad.

In short, for now, you're out of luck unless you can use the terminal pgm to custom-build your own macros.

The reason I say "for now" is NOT based on anything other than the following quote from the same manual, top of page 56:

"Apparently some Mac software cares, so I'll probably update this soon."

Since David Small participates here, perhaps this will be in one of your next (post-2.5??) updates. If so, I would also like to see the right mouse button CONFIGURABLE, so that I could finally generate a Mac "escape key" and be able to get some full use out of MicroEmacs under Spectre...

I'm extremely satisfied with the product as is, without any changes. But he just keeps on making the best even BETTER. Thanks, David.

David Shreiber writes:

" I heard a rumour that the Word Perfect disks for the ST in August 1989
contained a virus. I know I have had some problems with WP, while a
friend describes his as "rock solid." He tells me that a later version
of VKILLER (I believe 2.2) is necessary to identify and remove this
virus."

All six disks from WordPerfect that were sent to me have no
virus critters at all. My August 1989 disks were mailed to me in
December. Let's be careful about rumor propagation. In many cases
that is worse than a virus.
And, as usual, a call to WordPerfect's 800 number will clear
anything up: problems, unclear instuctions, etc.

>
> What exactly does the host adapter need to do? How similar
> are the protocols between the Atari DMA interface and a standard
> disk controller? How about between DMA and SCSI controllers?

The Atari DMA interface interface implements what some have called a "modified SCSI interface", since (1) the connector and interface specs regarding cable lengths, etc. is different from SCSI, and (2) the command descriptor block used to transmit commands to the device differs in that the opcode and controller number are both in byte 0 of AtariDMA but in different bytes within SCSI (there are other differences, as well). The host adaptors which I have seen convert AtariDMA <--> SCSI, and then will talk directly to a drive with an embedded SCSI controller, or will talk to a controller card (Adaptec or Omti are two popular choices) which does SCSI <--> ST506.

> what would be involved in actually building one of these interfaces?
> Would it be a simple FSM protocol converter with some buffering or
> are there more complicated things necessary?

Unknown by me. Looking at the ICD and BMS (Berkeley Micro Systems) boards, there appear to be three "sections" - one to do command restructuring, one to drive each side at the appropriate signal levels and handle arbitration, and an third which puts a clock at one of the AtariDMA bus addresses, since the early ST's didn't have an on-board clock, and there are other uses for the cartridge port (buy a Spectre GCR!!).

> Also, where can I get technical information on controller details
> and the Atari DMA port?

Become a registered developer with Atari, and you can get the docs. You will also have spent more than the cost of an ICD or BMS board (approx $125). But you did say it was for "fun", so perhaps the cost isn't an obstacle.

I love TeX, for doing text typesetting. I think that TeX is
great for doing papers and what-not but for signs and newsletter type
publications a WYSIWYG is best. I use TeX for doing my academic papers
and Calamus for doing newsletters and signs. It is not trivial to
move blocks of text around in TeX, leaving appropriate room for graphics
and what-not. A WYSISYG allows you to visualize the placement of
layout objects and include (visually!) graphics in your documents.
Althought TeX can do this it is a non-triavial task that is handled better
with a WYSIWYG, such as Calamus. Mind you, it takes TeX about 30 sec to
print a 300dpi page and Calamus about 3 min! TeX has its uses; it does
text typesetting in solid blocks much better than a WYSIWYG and a DTP
is suited better to layout type tasks. Comparing a DTP to TeX is really
like comparing apples and oranges - each is designed for different
purposed (TeX for typesetting, DTPs for layout). As a side note, I
prefer the Computer Mondern fonts to, say, Times Roman. Many people
argue with me about this...

Is there any reason that all of the programs for transferring files
between the Portfolio and and ST seem to use the serial interface? I
unfortunately had to purchase the parallel interface for use with my IBM
at work. I'd love to use the built in Portfolio transfer software to
transfer data files to my ST, but haven't seen anything out from Atari
for the ST, that will allow the transfer? THe only programs I have seen
seem to be PD programs using the serial interface. Is Atari coming out
with a program for the ST? Unless there is some technical problem, I
think it would be of great benefit to the users.

Source record: 243609

I am using Flash v1.6, and recently aquired a modem that will give the response "busy" when the line I am calling is engaged. There seems to be a problem with Flash though, in that when it gets the word "busy" back from the modem, it still remains in dialing mode. I have to click the modem a couple of times to get it out of that mode.
I have updated my dial menu and saved the configuration, for the word "busy" (as well as others), so that isn't it. The only clue I have is that it seems to temporarily cure itself when I replace the Flash.cfg (or whatever the Flash configuration file is called?) with my Flash.cfg file off my original Flash disk. This only seems to work temporarily though. Any ideas?

I second Larry Rymal's motion to suppress rumors. When I hear a rumor I ask for chapter and verse from primary sources. If folks on the net want to post messages es about viruses in software let them post messages about ones they have personally seen. The ST market has been lucky in this regard, I suspect that it is because the market is too small to attract the really competent virus mecahnics. George Woodside may be another factor because he works hard to keep them under control.

None of this keeps me from being really paranoid. I have invested close to $2000 in backup technology so that when the day comes when I have to rebuild everything I will be able to do so.

Well, I can recommend a good place to buy one (for that matter, any Atari equipment). It is the Computer Garden, phone 1-800-456-5689. Bob (the owner), unpacks and tests every piece of Atari equipment he sells (he is a registered Atari repair guy). I have bought my entire system from him, and I have never had a problem. I think his price is about $150 for a mono, and he aligns them if they need it before he sends them out. He might have some cheaper ones that don't meet his 100% spec. It is comforting to know that if any of my stuff breaks down, I can send it to HIM (not some unknown person) and get it fixed. I am in no way connected with him or his store, other than being a very satisfied customer.

1572. Re: Tape Drive Backup

Newsgroup: comp.sys.atari.st
Date: 1990-02-12 01:52:26 UTC
From: obryan@gumby.cc.wmich.edu
Message-ID: <1990Feb12.015226.25152@gumby.cc.wmich.edu>
Source record: 243616

In article <17425@laurel.athertn.Atherton.COM> alex@Atherton.COM (Alex Leavens) writes about a tape unit available from BMS: While I appreciate his sharing the info with the net, I honestly can't understand why anyone would choose the option he describes over the ICD FA*ST Tape Backup unit. I don't have any axe to grind here, I'm just a little perplexed and thought an opposing view should be aired. Perhaps there are other advantages to the BMS unit that I'm not aware of.

> It uses a standard size Un*x style cartridge
> tape mechanism and tapes (unlike the ICD unit, which
> uses a non-standard size) to allow you to backup/restore your
> hard-disc partitions on a file-system basis
> (there is no image backup yet).

Unless you're planning on transporting data to/from Unix boxes via this medium, I'm not sure what value this "standard" would have. Perhaps the intention is that the tapes are easier to find?

The ICD box allows both file-oriented and image backups, which comes in handy for Spectre (and possibly Minix?) partitions.

> Tape cartridge prices run about
> $15 each (less if you go to swap meets, where used Sun Microsystems tapes
> can be found for as little as $5).

While most places will try to charge anywhere from $30 to $40 for the CT-600N digital cassette tapes that the ICD box uses, I know of two places (at least) they can be obtained for $19 a piece. Since I don't know the capacity of the BMS tapes, I'm not sure how the $15 compares to the $19 for 155 meg capacity.

> Disc to tape speed averages
> about a meg a minute, which means that the average 10 meg partition
> can be backed up (assuming it's completely full) in roughly 10 minutes.
> One nice thing is that the backup doesn't need to be monitored,
> so you can be off doing something else while your hard disc gets backed up.
> (Like sleeping...:-)

Hmmm, impressive. The ICD unit runs 6-7 megs a minute, and also runs fully unattended. One disadvantage, of course, is that you only get to sleep 1/7-th as long ;-).

> Berkley MicroSystems will sell you a complete system (tape drive, controller,
> SCSI<->ASCI board, software) for $650. However, they say that since the
> cost of the tape drives mechanisms is so cheap, you can probably do a
> lot better by going out and buying a used tape drive yourself, and ...

The ICD box is $775 from Joppa Computers in Maryland, and I just ordered one from MicroTyme in Ohio for $765. Considering the capacity/performance of the ICD box, I don't see the BMS as any savings. I'm sticking a bare 100 meg SCSI hard drive inside the tape box, which saves me buying a box, power supply, and host adapter. Can you do this with the BMS unit?

[MicroTyme advertises the ICD for $799. I pointed out that my brother has bought over $1,000 worth of games from them, and asked if they could match Joppa's price. They beat it. I don't know if they would do this for anybody who asked, or if I got special treatment. They seem to be pretty nice folks though.]

> One caveat--you will need some technical expertise in order to put
> this system together. While SCSI stuff is pretty much plug and play
> these days, there is still a certain level of knowledge needed in order
> to prevent yourself from frying expensive components. (This is not
> a 'take it out of the box and run it' type system, you will have
> to get your hands dirty and assemble it.) Given that
> caution, if you're in the market for an inexpensive tape backup,

If your time is worth nothing, or you just enjoy doing it yourself, this may be a worthwhile option. Otherwise, I just don't see it. People seem to think the ICD box is awfully expensive (I know I did), but if you check out boxes on the Mac using the same streaming tape drive you'll find they run $1,000 to $1,700. That makes the ICD look almost cheap. When you consider that it has to have a host adapter (Atari DMA-SCSI), plus can hold a hard drive, and sells for $775, it's a steal.

If you really want to roll your own, the bare TEAC tape drives can be found for ~$400. Add $100 for a host adapter, $100 for a box/power supply, plus a little extra for miscellaneous cables and mounting hardware. You saved maybe $160 for your efforts. Now sit down and start writing the backup software. Doesn't seem like much of a savings to me. (I considered that option and rejected it. I might have come to a different conclusion if I was going to, say, stuff a whole stack of peripherals in a tower case.)

[The above has been a public service announcement. It's replete with my own personal opinions. Your mileage may vary. Do not exceed recommended doses. Void where prohibited by law.]

> better than this rubber crap we use now.

Diverse Data Products of Florida (800) 662-8662 is bringing out a $60 box in March that allows you to connect any IBM AT style keyboard you like to the ST. If you're interested, you might want to check them out. There are certainly plenty of options and lots of better keyboards in the PC world.

They're working on software right now to make sure it works with PC-Ditto and Spectre. Personally, I decided to pass on it for two reasons:

(1) it ties up the MIDI port, which I need, strange as it may seem, for... you guessed it... MIDI!

(2) you can't disconnect and remove the Mega keyboard, because it's still needed to supply the intelligent keyboard chip, and handle the mouse and joystick ports.

Your needs may differ from mine. I'd certainly like a better keyboard. I'm just not willing to give up my MIDI ports, serial port, parallel port, DMA port, etc. to get it.

I.C. Express has 1-meg chips (100 nS) for $8.15. They're in California, at
(800) 877-8189. I've dealt with them in the past and gotten prompt service.
They do add 3% for credit card purchases.

120 nS chips (probably even 150 nS) are plenty fast enough for the ST. It's
just getting harder to find anything slower than 100 nS these days (in 1-meg
packages).

monck@ibmpcug.co.uk (Paul Monckton) writes ...]

> Hi,
> Can anyone tell me anything about those MONITERM monitors?
> What are they like?

Big. Sharp. Monochrome. They're the same Moniterm monitors you might encounter plugged into a Macintosh or a hopped-up PC. The ST version includes a video board that plugs into the Mega internal bus. A program for the /auto/ folder called a "Physbase faker" causes console output to appear on the big monitor instead of the standard monitor.

Calamus looks great on the Moniterm. But some GEM programs won't like it. It's very easy to make assumptions -- such as 32000 bytes as screen size -- that are invalid when the Moniterm is installed. It's best to test any critical software before you make a commitment.

TOS/TTP (non-GEM) programs appear to work without worry (from my limited experiments), except for scrolling text. Because the CPU has so much data to wrestle with, moving text around on the big monitor takes a lot more time than on a standard monitor. You definitely don't want to run a text editor that scrolls a line at a time. Of course, since you're looking at an area that seems as big as a football field, you don't HAVE to scroll very often.

> How much are they?

I think they list around $1,600 U.S.

> Where can I get one?

I don't know about the U.K. In the U.S., any competent Atari dealer should be able to order one. They are made by Viking Moniterm in Minnetonka, Minnesota, USA. If your dealer can't help you, send me a note and I'll dig up Moniterm's address. (I don't have it here at home.)

Ahem... defecting?

By the way, you also might be interested in the Image Systems high-resolution display card for the Mega, which is around $600. It gives you 1024*768 monochrome or 16-color display on any 50kHz multisynch monitor. The manufacturer is Image Systems Corp., 11543 K-Tel Drive, Hopkins, Minnesota 55343 USA, telephone (612) 935-1171. I've seen this one in action, too, and it's very nice.

I am looking for a program which can convert GIF files to SPC. files in a command line environment. I know of the GIFSPC.PRG, but unfortunatly it requires large amounts of mouse interaction. I typically like to convert large numbers of GIF files to SPC files, but I'd like to automate the process instead of having to watch it and select new files everytime it finishes one of them. A GIF viewer that could display 320x200x512 colors would also be nice to have.

Please Email me at the address below.

Dear netters,
i downloaded bstat and opus from prog-a16@uoguelph. In the Bstat file
the gwbasro.prg was corrupted and when i used my gwbasro from gwbasic3.0
i wouldn't run cause of a bus-error. I couldn't look into the file with
gwbasic.prg. With opus i tried to make charts and used the gdos which
came with the gemini shell. I run the assigner and it was well though
i didn't see what the program did. The fontwidth.prg wouldn't run. When
i had the line 21 text in the assign.sys i stopped with error in font,
when i had 21p in it stopped without message. With 21r gdos wouldn't
load, telling me it couldn't find fontfiles. Has anyone an idea?
Sincerly

If you'd live in Germany, your problem would have been already solved. We
have published a way to connect 1.44 MB drives to the ST and read & write
720 KB _and_ 1.44 MB disks. Works perfectly, but involves some hardware
patching (will cost you <10 $). If you want to know more, get your hands
on "ST-Computer", issues 1/90 and 2/90, available from MAXON Computer,
Industriestrasse 26, 6236 Eschborn, West Germany, or snail-mail me for
further information (I can't be reached here): Claus Brod, Am Felsenkeller 2,
D-8772 Marktheidenfeld, West Germany.

>Back to one of the initial problems, Rainer -- how do we in Canada get a
>shareware registration fee to you. (I don't even know what the account
>number you refer to in your ARCGSH messages is for!)

Hmm, I don't know anything about the problems over there. I
thing we have to start a cooperation and try to work this out
together. (Money transfer should not be any problem at all for
huge amounts of money are shoveled around the world permanently
within a few minutes.

The following information I can provide: Here in Germany each
bank has a name (in my case it is "Postgiroamt Hannover") and a
unique number, the so-called BLZ (Bankleitzahl = bank code),
which is "250 100 30" in my case. Finally my personal bank
account has the number "4412 46-300".

To transfer money to me you should take the information above,
walk to your bank and ask the clerk how to do it. They are the
experts, they really should know. I would like to hear
how/whether you succeeded!

>Word Writer and First Word Plus were written by the same outfit - GST in
>the UK.)

The bug also occurs in TEMPUS 2.0, so it's not a proprietary GST bug.
It must be a quirk in AES; I don't think it's located in GEMDOS or lower-
level routines for they are documented very well here in Germany, and
someone would have come across the bug if it's been in GEMDOS or BIOS.
Since we have recompiled GEMDOS and BIOS source code, but no AES and
VDI source code, the only people to solve the problem are ATARI US.

I once read a msg related to this problem that stated that you could
escape the deadly repetition of the last few keys by pressing a combination
of SHIFT, CONTROL and ALT keys. This allows for quick saving before system
breakdown.

I received the August 18, 1989 release a couple of weeks ago. I assumed it was the last release. If you find out anything different, please let me know.

BTW, have you checked for crosslinked files while using Wordperfect. We used Wordperfect on IBM where I use to work and we always had problems with cross linked files. Now these problems are appearing on my HD. I've had duplicte directories appear within the directory that I keep my Text files; I've also had directories corrupted so that I could return to the parent directory from the desktop but not within a disk utility program like DLII.

> regarded as being juvenile, especially if you're posting to the net
> and said ELITE BBS!!!!! is a pirate board.

The Atari Elite ST Organization, Inc. is an ST-only usergroup based
in the Pittsburgh, Pennsylvnia area.

In accordance with the laws of the Commonwealth of Pennsylvania,
we--being a NON-PROFIT-ORGANIZATION--are incorporated as such in
Pennsylvania. (Yes, this is verifiable through records in Harrisburg, PA)

The Auto-Boss/Atari-Elite ST-BBS is *NOT* a pirate board. Why would you
assume such anyway???
Our board waas the first ST-only bbs east of the Mississippi...and the first
BBS (waybackwhen--) to run a 1030 modem on an 8-bit (long time ago)...

If YOU, Rob, or anyone who reads this would take a little time to investigate
things before you go making unsubstantiated claims then MAYBE I wouldn't
have to skip my Contemp.Bio. class right now...

********** For those interested in finding out about **********

> I have printed Metafiles with the Cad 3D II Hardcopy-program. I haven't
> been able to load these files to Easydraw or Timeworks, even if they use
> Metafiles, too. What's the reason for this?

Jalkio, (and others!)

the answer is to use version 2.3 of EasyDraw which can import CAD 3D
metafiles with ease, though you will find that shading is changed to a
uniform tone of grey.

If you don't have 2.3 you should upgrade through your distributor or
Migraph themselves. Migraph can supply a version 3 to owners who are
registered directly with Migraph.

Good luck

(I have no commercial connection with Migraph)

> No luck. So, I tried changing the LUN setting in ICDFMT from 0 to 1. This
> time, it formatted. It also verified all the sectors and said that

1. re LUN 0 -- you may have miss alligned the plug by 1 pin.
2. re LUN 1 -- The disk drivers (ICD, SUPRA, BMS) will stop looking
at a SCSI device if LUN 0 is not ready. They will then never test LUN 1.
-- I rewrote mine to test LUN 1 also.

-- Of course, Atari, NEVER test LUN 1!

Your initial problem is typical of the problems with expanding/changing
a disk interface. The drive is connected by 2 cables each of which may be
upside down, and the LUN (small) cable can be plugged in 2 places. Lots
of ways to do it wrong; only one way to do it right. The good news is that
the wrong ways (listed above) do not seem to damage anything.

Now that you know it works, try going back to LUN0. It'll probably work great.

I own a harddrive with ICD hardware and software.
After a long time without any problems I now get an error-message once in a
while.
The ICD harddisk-driver says SENSE $16 or SENSE $17 in the top-line of
my desktop.
Who knows what this message means and if I'll get into trouble reading my
data from the drive ????

Hope to get any answeres 'cause I don't know what to do ...

Chris

> writes about a tape unit available from BMS: While I appreciate his sharing
> the info with the net, I honestly can't understand why anyone would choose
> the option he describes over the ICD FA*ST Tape Backup unit. I don't have

First you need an Atari Host Adapter that handles multiple SCSI correctly.
BMS-200 does this. ICD FA*ST claims to. LATE issue SUPRA claim to.

Second ingredient is the Adaptec 3530A Adapter.

Third ingredient is a Archeive or equivalent QIC-36 tape unit.

All in all, its not cheap. But the best way to back up large HD's.

A note on speed. The tape units run at the same speed. For 1:1 formatted
HD's, the software can read in 1 track (17 sectors) while writing it to
tape (using the internal buffer in the 3530A. (for purests, the tape will
only accept 16 sectors at a time, so the HD has to be able to read across
the head switch very quickly.)

The goal is to keep the tape moving continuously. If at any time it runs
out of data to write, it must write a long trailer, stop, backspace,and
wait to restart. This is really slow.
If the drive doesn't seek fast enough (sh204), the tape stops from
time to time and has to restart.
If formatted 2:1 or worse, the HD allows you to format for 18 sectors/track.
And the backup writes 16 sectors and stops (see above), then restarts.
The Tape sounds busy, but quickly drops to 1 meg a minute or worse.

I have a BMS-200, controlling 1 3530A tape, and 2 Adaptec 4000A connected
to HD's. Formatted 1:1 with my own backup software (derived from BMS's
early work) I get 6-7 megabyte per minute. I definitely appreciate being
ATT and SUN compatible. (I got Jwahar Bammi to send me all of gnu-xxx
on 1 tape written on a SUN; read it in and go. WOW!).

I would definitely recommend Cartridge Tape for backup. The bigger the
HD, the more you need it.
BMS makes good stuff, it is aimed to the do-it-yourselfer. ICD has a
a good sounding product and package. Either way it is a good way to go.

I save partitions, rather than raw disk by sector number. This lets be
do two things. One, I can restore a single partition or copy it to another
disk. Second, by judiciously rewriting tos.c from MINIX, I can actually
access and read files from the tape directly. The ultimate for the
Cartridge Tape is to adapt a CPIO clone (such a gnuxxx) to read and write
the CT. This is then compatible with UNIX(r), MINIX, and TOS.

> 2. an HP LaserJet
> 3. Postscript

The drawing tools in Pagestream 1.8 are very good. After you're done,
you simply load the printer driver you want from Pagestream's wide
selection of output modules, which includes the HP Laserjet and Postscript.
I have both the HP Deskjet and the Paintjet, and the output quality on both
is excellent.

If you want to merge these drawings into troff documents, I suggest you
convert your troff output to postscript first, with a postscript
post-processor. Then merge the postscript generated from Pagestream into it.

>I would love to be able to read the Gadgets newsletter from the net. Possible
>solution might be to upload it to comp.binaries.atari.st as a UUE'd ARC file.
>Or for that matter, Panarthea or Terminator would be great too.

I would like to read this newsletter too. Dave has a nice, easy style of
writing, sometimes chatty, that is fun to read. But clearly, it does not
fit the classification of the existing atari news groups.

The best solution is to make it available on servers such as "panarthea"
and "terminator". Terminator has the advantage that a relatively small but
growing number of folks may access it via ftp. Panarthea has the advantage
that folks on every network that carries these articles can reach it by mail,
if they know the gateways and bridges between networks.

Maybe "well" could set up the software to handle a file server by mail?
Correct me if I am wrong, but I think that S.Grimm got his software (or
at least the original command set) from Martin Wiedmeyer in "lakesys"
and he may be willing to supply his stuff to others who want to start a
file server by mail.

The official address is archive-server@panarthea.ebay.sun.com.

Oh, what the hey, it's about time I posted this again:

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: October 13, 1989

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on

your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, a new archive program called "zoo" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others. Unfortunately, you can't unpack a zoo archive with arc, or vice versa.

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for

people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its archives.

Using Binaries -3-

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does

not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source

code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know

about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program,

send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

1601. vote on comp.periphs.scsi

Newsgroup: comp.sys.atari.st
Date: 1990-02-12 17:01:08 UTC
From: emv@math.lsa.umich.edu
Message-ID: <EMV.90Feb12120108@duby.math.lsa.umich.edu>
Source record: 243566
Cross-posted to: comp.sys.amiga.hardware,comp.sys.mac.hardware,comp.sys.atari.st,comp.sys.ibm.pc

I put forth the idea of comp.periphs.scsi about a month ago on
comp.periphs and a few other groups. Reaction to the idea was almost
entirely positive, reaction to the name was pretty good. The call for
votes went out to news.announce.newgroups on Feb 9; this means if
the vote passed the group will be created early March.

The idea of a comp.periphs.scsi is to collect all of the hard-won
information about various SCSI peripherals that's uniform across
all platforms. I anticipate a fair amount of cross-posting into
this group from the comp.sys.*.hardware groups.

Please mail votes to
To: emv@math.lsa.umich.edu
with the header
Subject: YES vote on comp.periphs.scsi
or Subject: NO vote on comp.periphs.scsi

I'll collect these, tabluate them, and let you know what the
result is through news.announce.newgroups.

Please redirect followups to comp.periphs for substantive SCSI
discussion, news.groups for formal or procedural issues.

This may sound strange, but I personally, like the keyboard on my 1040ST
much better than the keyboards which come standard with an IBM AT, PS/2,
or (much worse) PC.

One of the things I learned in High School was how to touch-type. My
fastest typing to date was 80+ words per minute on a professional
desk-top-publishing workstation. (I don't recall the make.) This
had a keyboard so sensitive that you could almost type on it by
blowing on the keys!

The keyboard on the ST isn't as nice as this, of course, but I can still
get a respectable 45-50 wpm while typing on it. My only real complaint
about the ST keyboard is that the keys seem slightly farther apart
than others, but that is something one's fingers quickly get used to.

On an IBM, for comparison, I have NEVER hit faster than about 20-25 wpm.
The reason is that you must press the keys so far down before getting
a character. When you push it all the way down it gets the further
resistance as the switch is activated. This may be fine for those who
don't do much typeing, but if you have been trained to touch-type, your
fingers want to move to the next key as soon as they have hit the top
of the current key. That is, if they don't have to push the key all
the way down, they can move to the next key faster, resulting in better
typing times.

Of couse this is all just my personal opinion and (from much of what is
seen on the net) there are many of you who don't agree with me.

This also really has nothing to do with the creation of replacement
keyboards. Replacement keyboards are a good idea since they allow
the user to choose the one he wants. (For example, there are some
really good touch typing keyboards for the IBM but they tend to be
pretty expensive.)

If you don't agree with me, that's fine; I just thought it was time
to get an alternate opinion on the net and say to the people at
Atari that there is someone (me) who does like their keyboard.

From: rjd@cs.brown.edu
Message-ID: <28923@brunix.UUCP>
Source record: 243567

If this has been brought up before, I apologize, but...

There was a virus contained in the first 100 to 150 disks
of the $10 upgrade to Pagestrem 1.8. (If you purchased the
$25.00 upgrade, this does not pertain to you.)

This is directly from the horse's mouth, as it were...the statement
was issued by SoftLogik, Inc. to the ST Report. It the statement it
is refered to as the "key virus." (Anyone hear of this?) Any of the
anti-virus programs should take care of it, but Soft Logik is,
of course, exchanging disks if you are nervous.

Please contact Soft Logik, as I have no further information beyond
that.

So you want it to be fast, reliable, and do everything but wash the kitchen sink but you don't want to pay for it???? Typical.

Besides the TOTAL lack of support from Atari Corp.(products, marketing, and distribution) the single most important factor contributing to the decline (and eventual death unless something changes) of the ST is the unwillingness of users to PAY for quality software. NOBODY wants to develop software for a machine that you can only sell 500 copies of a program before it's on half the bulletin boards across the country.

Unless Atari starts selling more machines so there are a few more users to buy software AND unless ST users start supporting the machine through the purchase of quality software there won't be any quality software to purchase!

Source record: 243572

obryan@gumby.cc.wmich.edu (Mark O'Bryan) wonders why I like the
BMS Tape backup unit better than the ICD unit.

Well, first off, I don't like it better; I've never used the
ICD unit, so I can't really say. The BMS unit is a do-it-yourself
type box, and the ICD isn't. There are some of us (me included, :-)
who actually like putting something together, rather than just taking
it out of a box. (If I bought an ICD unit, the first thing I'd do
would be to take it apart and see how it works! <grin>).

>Unless you're planning on transporting data to/from Unix boxes via this
>medium, I'm not sure what value this "standard" would have. Perhaps the
>intention is that the tapes are easier to find?

The standard cartridge tapes are very easy to find; my basis for this
comment was one ICD owner who mentioned to me that the tapes for
that unit seemed to be hard to find and expensive.

>The ICD box allows both file-oriented and image backups, which comes in
>handy for Spectre (and possibly Minix?) partitions.

Actually, there's one person on the net (Howard Bell), who's got image
backup working for the BMS unit.

>While most places will try to charge anywhere from $30 to $40 for the
>CT-600N digital cassette tapes that the ICD box uses, I know of two places
>(at least) they can be obtained for $19 a piece. Since I don't know the
>capacity of the BMS tapes, I'm not sure how the $15 compares to the $19
>for 155 meg capacity.

Typical cartridge tapes are between 60 and 300 meg capacity.

>Hmmm, impressive. The ICD unit runs 6-7 megs a minute, and also runs fully
>unattended. One disadvantage, of course, is that you only get to sleep
>1/7-th as long ;-).

Yes, but if you used to use floppy, then it _is_ a heck of a difference.

>If you really want to roll your own, the bare TEAC tape drives can be found
>for ~$400. Add $100 for a host adapter, $100 for a box/power supply, plus
>a little extra for miscellaneous cables and mounting hardware. You saved
>maybe $160 for your efforts. Now sit down and start writing the backup
>software. Doesn't seem like much of a savings to me. (I considered that
>option and rejected it. I might have come to a different conclusion if I
>was going to, say, stuff a whole stack of peripherals in a tower case.

Your prices aren't right. BMS will sell you a very nice tower case
with power supply and fan for ~$50. (It's big, though). Tape drive

mechs, used, are nowhere near $400--$100 is more like it. (And I've seen them for even less). So for $250, you can have drive, host adapter, box, power supply and cables. When you buy the BMS board, if you tell them what you're using it for, they give you the backup software too. So your cost is more like $250, and it's not a savings of $160, but more like $500-$600. This is worth it, IMHO. (Especially if you like getting your hands dirty :-).

Again, I haven't used an ICD unit at all; from everything I've seen, they are very nice units. I was just trying to give people a pointer to another option which is worthwhile in checking out, especially if you have more time than money.

I helped found the Nashua Area ST User Society (NASTUS) several years ago and have been its president for the past year. Prior to that I was the club software librarian. So I can say with authority that our club has NEVER condoned or engaged in this sort of activity. In fact, when we officers heard a rumor of a local BBS offering pirated ST software, we included a note in our newsletter saying we are strongly against pirating.

I also attend the Nashoba Valley ST User Society (NAVaUS), and was their librarian for a year. Same thing there. In fact, at one time a member pointed out that I had inadvertantly included a commercial telecommunications program in our library. After verifying that what he said was true, I removed it from the library.

Going further, I previously attended meetings of the ST subgroup of the Boston Computer Society, knew the librarian, and swapped public domain disks with him. Neither he nor the members dealt with any pirate software that I was aware of.

So while I can't speak for clubs I haven't attended, all three ST clubs I've associated with in the past five years have in no way even come close to software pirating orgies.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I have seen the Phantom strike in both Word Writer and 1st Word Plus. In
both cases, his appearance always immediately followed some keyboard
confusion on my part. In particular, I would type too fast and botch it
up, try to backspace quickly, botch that up, try to type the correction,
generally just hitting an awful lot of keys in quick succession. It's
kind of spooky the way the Phantom seems to get fed up with my
incompetence and begins to do the typing himself. Unfortunately, he is
a much slower typist than me.

Has anybody else noticed any correlation between rapid sequences of
keystrokes (involving multiple backspaces) and the appearance of the Phantom?

You can, sort of. What it sounds like "they" are talking about is taking an MFM drive and formatting it RLL (or, in layman's terms, squeezing more data into the same space). This would require you to get an RLL interface? to replace the MFM one, making sure that the drive in question will work with the RLL board.

Even if you get it to work, I wouldn't trust it. The drive was only certified for 20 megabytes of capacity; going 30 would probably give you lots of grief when your data just started going bad.

Easiest way to get more space is to get more hard drive. :-)

Mike

I have decided to replace my ST mouse with a Microsoft Mouse (have to do a little soldering, very simple mod). I have seen so many reports of ST mice dying that I have given this matter thought. However, some interesting questions come to mind.

1. To my knowledge, there are three types of ST mice around. The very first ones were marked as being from Germany. The next batch is made in Taiwan (I think), and has a sliding mouse-ball door, and plain metal rollers which get all gummy with heavy use. The new ones have a rotating ball door, and have white plastic covers on the metal rods, and do not seem to collect nearly as much gunk. Are there any more types?

2. I happen to own one of the new ones (fat plastic roller covers). It has laughed at my attempts to wear it out. It doesn't make any of the weird noises that I hear from the older types (after some use). Are my Microsoft plans unfounded? Has Atari actually produced a long lasting mouse? Mine seems to feel smoother than the older types, buttons feel the same.

Enquiring minds want to know!!

Message-ID: <1990Feb12.205652.12645@gpu.utcs.utoronto.ca>
Source record: 243571

I am seriously considering getting the TeX diskettes from the Current Notes' Library, but first I have some questions which I hope netters can answer.

Here at the museum, we use SoftQuad's troff system on a Xenix box coupled with a PostScript printer. One of the nice things about this is that we can take advantage of all of Adobe's fonts. Some of the one's we find useful are Goudy Old Style, Palatino, Futura. Does TeX, in its public distribution, have any means of supporting Adobe fonts or similar typefaces?

1617. RT(E) Monitors

Newsgroup: comp.sys.atari.st
Date: 1990-02-12 21:29:41 UTC
From: zasl@tank.uchicago.edu
Message-ID: <7590@tank.uchicago.edu>
Source record: 243575

I am new to all this so please forgive if this has been covered recently. I am shopping for an STE and was wondering about monitor questions. Is the Atari SC1224 the best and only choice for a color monitor or will any RGB do? For example, in my J&R Music World catalogue there is a Magnavox "8562/8762" advertised for *much* cheaper.

Any comments or recommendations would be greatly appreciated as well as references to previous notes, horror stories, detc.

Thank you.

1619. Becoming an Official Atari Developer!

Newsgroup: comp.sys.atari.st
Date: 1990-02-12 21:53:03 UTC
From: covertr@force.UUCP
Message-ID: <489b42d9.14a1f@force.UUCP>
Source record: 243641

The following are notes about becoming an Official Atari ST Developer in the United States. I would be interested in hearing from our friends in Europe about the rules for becoming a developer there. But now on with the show!!

I called Gail Johnson in early January 1990 to inquire about becoming an Official Atari ST/TT Developer. I was sent a large envlope withing a week. The envelope contained a description of the current plan which is a single level plan costing $250.00. The Developer MUST be developing a COMMERICAL product for the ST. The Developer MUST submit 3 copies of said product to Atari Corp. the Developer MUST re-register annually. The packet I received said a LOT about what the Developer must do, but very little about what the Developer receives for his $250.00.

Basically, all the Developer gets for his $250.00 is some mailing lists from Atari Corp. And the option of having his products (demos thereof) being distributed by Atari Corp to all Atari dealers.

The packet did NOT contain any information about what sort of Developer software, or Developer Documentation would be provided by Atari Corp.

So, I called Gail Johnson to ask about all this. I was told that Atari had multiple levels of Developers, one of which included the Mark Williams C compiler and cost $250.00. Another level, which did not include the MWC C compiler was $100.00. As I currently own, and use, MWC I wanted to sign up for the $100.00 Developer Program. Gail Johnson informed me that such a program was dropped as of December 31, 1989. So, as of Jan 1 1990 there is only one Developer Program which costs $250.00. And it doesn't even include the MWC C compiler. It contains the OLD OLD Alycon C compiler, which I have heard is VERY VERY bad.

so, my question is Why Did Atari change their Developer programs to eliminate the lower cost option??

Why did Atari Corp drop the MWC C compiler and start shipping the Alycon compiler??

I had really palnned to sign up as a Developer but now I am having serious doubts. I don't want the Alycon compiler, and I don't like the $250.00 price tag. I do some part time C programming at home, and don't plan to market a commerical product. So, where does that leave me?? Out in the cold I believe.

I wish that Atari Corp would try to help their customers more, and this new DEvelopers program is not a good way to start a new decade.

Message-ID: <489b5577.14a1f@force.UUCP>
Source record: 243642

I want to thank Michtron (and Ann@Michtron) for their prompt upgrade
to my copy of WERCS. I sent in a floppy on Wednesday Jan 31 and received my
upgrade on Sat Feb 10. Ann told me that Michtron shipped it on Tuesday Feb 6.
So, it is nice to see a company respond so quickly to a customer. BTW, the
upgrade was FREE, with just a nominal $5 charge for shipping and handling.
Very fair for a package like WERCS.

Also, could someone in England tell which is the latest version of WERCS
over there?? Michtron has Version 1.16, which is what I received. Is there
a newer versio of WERCS in England?? If so, how can I get it?? I have the latest
version that Michtron has.

Thanks for a great product.

From: marauder@nadia.UUCP
Message-ID: <769@nadia.UUCP>
Source record: 243643

There's a rather annoying bug in Ultima V. After inserting a write-protected 'Player/Underground' disk (which is the save disk) you're told that that's the wrong one and to insert the right disk. All you have to do to damage your disk is removing the write-protect, put it back into the drive and hit any key... Then, when you try to leave Iolo's hut, the game hangs saying 'offsetmap'.

Stefan.

1625. disk caches for 1040ST

Newsgroup: comp.sys.atari.st
Date: 1990-02-13 00:15:17 UTC
From: mikew@wheeler
Message-ID: <3561@tahoe.unr.edu>
Source record: 243645

Can someone please recommend some disk caching programs for the
1040ST (1.0 ROMS)? Maybe a comparison of what is available?

I tried lcache but found noo doc files. I am not quite sure if I
used it correctly or if there is a bug in it.

I also tried dcache (Dijkstra). I believe it only caches read
buffers and not write. I would like to cache both read/write
operations (floppy and hard disks) and have control over
flushing the buffers (e.g. a 'sync' command).

PD, freeware, shareware, commercial--- all fine.
Thanks!

I would like the know just what is wrong with wanting to get a useful piece of software as cheaply as possible. As I recall there are very GOOD packages for non-Atari computers in the public domain (PD/Shareware) that do things as well or better than commercial packages at a fraction of the cost. What's the matter, having a bit of hard luck??

>

Even though the first part of the above statement is for the most part true, I think that it is ENTIRELY uncalled for to make such a statement vis-a-vis commercial software on Pirate BBS'es. You obviously have a serious attitude problem.

> Unless Atari starts selling more machines so there are a few more users to buy

Hm, a disgruntled (but obviously otherwise gainfully employed) developer, eh?

In response to the original poster's request, I have used the TURTLE backup program by George Woodside successfully for a number of years now. It should be available from the various servers (I'm sure it's at terminator...). If you are unable to ftp, you can get it off of my wife's BBS 7 days a week, from 10PM-7AM MST. The number is: 602-578-9115. I hope that this helps you out, Mr.(?) Steinmeier.

Actually, the logical sector size was also increased to 1024 bytes, along with some other modifications. Maximum partition size is now 1024 Megs, or 1 gig. I'm presently running off of a 40 meg partition, and I wouldn't go back for anything.

>access the hard disk (such as disk checkers might do) must understand
>this convention, or else they will get confused by the (apparently)
>negative sector numbers (i.e. any in the second 16 Meg with the
>high-order bit set).

The big problem now is that the program may not be able to deal with the 1024 byte logical sectors, since most just assume 512 byte sectors. The physical sectors, however, are still 512 bytes.

>get about 4 Meg of stuff in a partition, the old Dfree()/FAT search

This "attitude" is is derived from finding Diamond Back on no less than 20 BBS's within 3 months of it's initial release.

>> Unless Atari starts selling more machines so there are a few more users to buy
>> software AND unless ST users start supporting the machine through the purchase
>> of quality software there won't be any quality software to purchase!
>

>While I do agree with the necessity of support for commercial software for the
>ST, I dislike the tone that you have used in your little tantrum. If you can't
>make a positive contribution to the net, then just BE QUIET!

I dislike losing hard earned money through software theft. If someone came into your home and stole your TV and then you saw it at the flea market wouldn't you get upset?? I dislike the tone of your response because I have made positive contributions to the ST community. If you can't handle that then you should just BE QUIET.

>Hm, a disgruntled (but obviously otherwise gainfully employed) developer, eh?

Well, a man's got to eat.

Hey, this line of discussion is counter productive. Flame off ok?

1639. DEC keyboard as ST replacement

Newsgroup: comp.sys.atari.st
Date: 1990-02-13 10:02:15 UTC
From: mwjester@wsucsa.uucp
Message-ID: <13203@wsucsa.uucp>

Has anyone tried out the package that supposedly allows one to connect a DEC LK201 keyboard to the ST? (I think the package is at Terminator.) I have been using DEC keyboards for some time now, and an LK201 would be my choice if I was looking for a 'better' keyboard for the ST.

Max J

1640. Re: STe

I was considering selling my old 520ST and buy the new STe since I thought I could upgrade to 4 meg cheeply. However, today I was told by a dealer that the STe doesn't use industry standard SIMM chips but rather somthing else (he said SIPP). And these new chips aren't even available yet. Is this true? Will they be more expensive than SIMM chips?

I haven't noticed the problems you've mentioned but then again, I haven't changed the tabs much yet. I assume you put the at the correct place in the document? I remember my first experiences with Word Perfect I'd change the margins but everthing came out wrong. I'd forgotten that you had to go to the top of the document first.

Have you checked your HD since you installed WP? I'm curious to see if others are having the crosslinked file problem I'm having.

[The basenote asks me to tell more about the Appletalk board for the ST].

Really, it's a bit preliminary. Right now, with a board that we have, we can print to an Apple LaserWriter from Spectre (Mac) mode, and coexist on a network with a Mac II. We've not yet tried fancier network things; getting the Apple LaserWriter printing means good things are working.

However, there are things to be done and added, PC boards to be made, packaging, et all. I'd expect many moons of delay before it finally ships; we want it to *work* without any hassles.

This board should also allow *high* speed networking amongst ST's, provided someone will write some driver software. It sure beats the 31K buad of the SGS net... Appletalk is up at around 230Kbaud, I believe.

So, it opens up all sorts of intersting possibilities.

Again -- this is not going to be ready for quite some time. We've asked for a few design changes to help make MIDI possible, since we're 90% there anyway with this board, and that rev of the board is not done, though close.

Anyway, that's what's going on. I'd appreciate it if no one tried to get in a "first order"; it will be *months* before we'll accept any.

-- thanks, Dave / Gadgets

YES, also multiple mouse clicks as menus drop ...

1) how about a problem with EventMulti (as a first guess)
(new interupt while processing first one)
- comes back to previously suggested problem of spending too long
in an interrupt - because of two interrupts ???
else,
2) how does keyboard uP react to interrupts when already handling one ?

fairly easy to check which is at fault :
put a hardware monitor (scope, monostable with LED) on the serial data
to the 6850 in the ST, look for transitions when the Phantom is typing.

Presumably the long delay bewteen keystrokes is caused by a counter
getting out of the expected range, and then having to wrap round.

i.e., suppose a buffer is being emptied (until 'low-water mark' is reached)
if an equality test is missed due to interleaving interrupts, the counter
will have to wrap round (via 64k/.../...) to reach equality.

The cure may be as simple as changing an equality test
for an `equal or less than' test. (somewhere!)

probably totally wrong, just my best guess to date.

cheers

Cross-posted to: comp.sys.atari.st,misc.forsale

just yer basic 1040 but with 2.5 M of memory with sm124 (the monochrome monitor).

Also an sh204.

Will consider selling separately. Make me an offer, I want to get rid of this thing.

I heard rumours some time ago that this was a side-effect (maybe or maybe
not intentional) of an early PD program called UHRLI.ACC, which when
selected would put a small digital clock display inside a tiny window.
I certainly have not seen the problem since I bought a cheap digital
watch to hang beside the computer, and stopped using UHRLI. May just
be coincidence, though.
